Earth Science and Environmental Engineering

## CERTIFICATION STATEMENT

This *Annual Groundwater Monitoring and Corrective Action Report, Alabama Power Company - Plant Miller Ash Pond* has been prepared in accordance with the United States Environmental Protection Agency's coal combustion residual rule (40 CFR Part 257, Subpart D) and ADEM Admin. Code r. 335-13-15 under the supervision of a licensed professional engineer in the State of Alabama. As such, I certify that the information contained herein is true and accurate to the best of my knowledge.

## EXECUTIVE SUMMARY

In accordance with the United States Environmental Protection Agency (EPA) coal combustion residual (CCR) rule (40 CFR Part 257, Subpart D) and the State of Alabama Department of Environmental Management (ADEM) Admin. Code Ch. 335-13-15, this 2020 Annual Groundwater Monitoring and Corrective Action Report has been prepared to document 2020 semi-annual assessment groundwater monitoring activities at the Plant Miller Ash Pond and to satisfy the requirements of § 257.90(e) and ADEM Admin. Code r. 335-13-15-.06(1)(f). Semi-annual assessment monitoring and associated reporting for Plant Miller Ash Pond is performed in accordance with the monitoring requirements § 257.90 through § 257.95 and ADEM Admin. Code r. 335-13-15-.06(1) through r. 335-13-15-.06(6).

The CCR unit began the monitoring period in assessment monitoring pursuant to § 257.95 and ADEM Admin. Code r. 335-13-15-.06(6). Statistically significant increases (SSI) of Appendix III constituents over background were identified in the results of the first detection monitoring event and assessment monitoring was initiated in January 2018. Statistically significant levels (SSL) of Appendix IV parameters above groundwater protection standards (GWPS) were identified while in assessment monitoring. Consequently, an assessment of corrective measures (ACM) was initiated on January 13, 2019 and completed on June 12, 2019 according to the requirements of § 257.96, ADEM Admin. Code r. 335-13-15-.06(7), and ADEM Administrative Order No.18-098-GW. The ACM was subsequently submitted to the Agency and posted to the Site CCR compliance web site.

The following summarizes activities for 2020 groundwater monitoring activities at the site:

- Submitted the Semi-Annual Progress Report for Groundwater Delineation Activities on March 30, 2020.
- Submitted a Groundwater Monitoring Well Installation and Abandonment Request February 19, 2020 and revised April 22, 2020 that was approved by ADEM May 4, 2020.
- Submitted the revised Groundwater Monitoring Plan on April 15, 2020, responded to ADEM comments and resubmitted the Groundwater Monitoring Plan on August 24, 2020.
- Submitted the Semi-Annual Remedy Selection and Design Progress Report in June 2020.
- Abandoned nine downgradient monitor wells (MR-AP-MW-7S, MR-AP-MW-7D, MR-AP-MW-8S, MR-AP-MW-8D, MR-AP-MW-9S, MR-AP-MW-9D, MR-AP-MW-13S, MR-AP-MW-13D, and MR-AP-MW-14) due to ash pond closure activities on June 16 and 17, 2020 and installed replacement downgradient monitor wells between June 29, 2020 and July 15, 2020.
- Submitted 2020 Semi-Annual Groundwater Monitoring and Corrective Action Report on July 31, 2020.

- Abandoned previously installed unsuccessful horizontal delineation wells (MR-AP-MW27H, MR-AP-MW-29H, and MR-AP-MW-36H) between August 9, 2020 and August 22, 2020 and installed replacement wells (MR-AP-MW27HR and MR-AP-MW-36HR) on August 9, 2020. The replacement horizontal delineation well (MR-AP-MW-29HR) boring was abandoned August 5, 2020 due to the presence of predominately mine spoils.
- Installed four additional upgradient monitor wells (MR-AP-MW-23A, MR-AP-MW-22S, MR-AP-MW-22I, and MR-AP-MW-22D) approximately two miles west-northwest of Plant Miller between August 18, 2020 and September 2, 2020.
- Completed the installation and development of the replacement downgradient monitoring wells, horizontal delineation wells, and additional upgradient monitoring wells between June 26, 2020 and October 6, 2020.
- Submitted Semi-Annual Progress and Groundwater Delineation Report on September 30, 2020.
- Sampled the replacement downgradient and additional upgradient monitoring wells during the second semi-annual sampling event between October 12, 2020 and October 27, 2020.
- Identified Appendix IV parameters arsenic, cobalt, and lithium at statistically significant levels (SSL) above GWPS.
- Continued the evaluation of monitored natural attenuation (MNA) and geochemical manipulation as potential groundwater remediation technologies for the Site as described in the Semi-Annual Remedy Selection and Design Progress Reports submitted in June and December 2020 in accordance with the EPA CCR rule 40 Code of Federal Regulations (CFR) § 257.97(a) and the ADEM Admin. Code r. 335-13-15-.06(8)(a).
- Submitted the Semi-Annual Remedy Selection and Design Progress Report on December 12, 2020.
- Pursuant to 40 CFR § 257.90(e)(6), Executive Summary Table – Monitoring Period Summary has been prepared to describe the status of groundwater monitoring and corrective action during the monitoring period for this report.

The CCR Unit concluded the monitoring period in assessment monitoring and Alabama Power Company (APC) is evaluating potential groundwater remedies identified in the ACM report submitted to ADEM in June 2019. The following monitoring-related activities are planned for the CCR Unit:

- Collect additional data to further evaluate remedies selected as feasible for the remediation of arsenic, cobalt, and lithium as described in the ACM.
- Continue to compare site-specific corrective actions to the evaluation criteria in the CCR Rule, with emphasis on deficiencies that could eliminate a corrective action from further consideration.
- Continue to determine how corrective actions could be integrated with pond closure, such as dewatering and associated water treatment systems.
- Develop plans for additional Site investigations and associated laboratory work to determine MNA capacity, rates, and stability; and plans for laboratory treatability and/or field pilot tests to determine the effectiveness of geochemical manipulation as needed.
- Perform laboratory treatability studies and implement field pilot tests as needed.

- Submit the next Semi-Annual Progress Report by March 30, 2021.
- Submit the next Semi-Annual Remedy Selection and Design Progress Report by June 12, 2021.
- Conduct the first semi-annual assessment monitoring event in the first half of 2021 and submit the annual groundwater monitoring and corrective action report summarizing the findings to ADEM by July 31, 2021.

## 1.0 INTRODUCTION

In accordance with the United States Environmental Protection Agency (EPA) coal combustion residual (CCR) rule (40 CFR Part 257, Subpart D) and the State of Alabama Department of Environmental Management (ADEM) Admin. Code Ch. 335-13-15, this 2020 Annual Groundwater Monitoring and Corrective Action Report has been prepared to document 2020 semi-annual assessment groundwater monitoring activities at the Plant Miller Ash Pond (Ash Pond) and to satisfy the requirements of § 257.90(e) and ADEM Admin. Code r. 335-13-15-.06(1)(f). Semi-annual assessment monitoring and associated reporting for the Ash Pond is performed in accordance with the monitoring requirements of §§ 257.90 through 257.95 and ADEM Admin. Code r. 335-13-15-.06(1) through r. 335-13-15-.06(6).

# 2.0 SITE LOCATION AND DESCRIPTION

The APC James H. Miller, Jr., Electric Generating Plant (Plant Miller) is located at 4250 Porter Road, Quinton, AL 35130-9471. Plant Miller is approximately 15 miles northwest of Birmingham in western Jefferson County, Alabama. The plant occupies Sections 21, 22, 27, 28, 29, 32, 33, and 34, Township 16 South, Range 5 West and Section 4, Township 17 South, Range 5 West. Section/Township/Range data are based on visual inspection of USGS topographic quadrangle maps and GIS plant boundary files provided by Southern Company (USGS, 1982; USGS, 1983). The Ash Pond is located south of the main plant. **Figure 1**, **Site Location Map**, depicts the location of the Plant and Ash Pond with respect to the surrounding area.

## 2.1 SITE GEOLOGY AND HYDROGEOLOGY

### 2.1.1 Physical Setting

Plant Miller is located in the Black Warrior River basin, an area typified by moderate relief, with river and stream valleys having dendritic drainage patterns. Elevations at the Site range from approximately 260 feet above mean sea level (MSL) near the Locust Fork to over 550 feet MSL along ridges north and south of the Ash Pond. **Figure 2**, **Site Topographic Map**, provides the topography of the Site.

### 2.1.2 Geology and Hydrogeology

Plant Miller lies in the Warrior Basin physiographic region (Sapp and Emplaincourt, 1975), a late Paleozoic basin formed as a result of flexure and sediment loading associated with Appalachian and Ouachita orogenies. The bedrock geology is dominated by clastic sedimentary rocks of the Upper Pottsville Formation as shown on **Figure 3**, **Site Geologic Map** (Geologic Survey of Alabama, (GSA), 2010b). This formation is characterized by cyclic sequences (cyclothems) of marginal marine shale/claystone, siltstone, sandstone, conglomerates, and individual coal beds. These depositional cyclothems reflect the sediment balance controlled by $4^{th}$ or $5^{th}$ order glacial eustasy, continued basin evolution, and variations in sedimentation rates (Pashin and Raymond, 2004). Deeper stratigraphy is marked by carbonates, shales, chert, and sandstones of Mississippian to Cambrian in age (Raymond et al., 1988).

The Plant Miller Ash Pond is directly underlain by rocks belonging to the Mary Lee, Gillespy, and Pratt Coal Groups (Ward II et al., 1989) of the Upper Pottsville Formation. In general, each coal group consists of mudstone, shale, fine-grained sandstone, and interbedded coal in fining-upward sequences.

Each coal group is bounded by a maximum flooding surface and marine shale unit. Upper Pottsville strata at Plant Miller are on the southeast limb of the Sequatchie Anticline and dip to the southeast between 3° and 5°. **Figures 4A, Geologic Cross-Section A-A' through 4E, Geologic Cross-Section E-E'**, illustrate the Pottsville Formation strata underlying the Site.

Bedrock discontinuities measured during geologic mapping and downhole geophysical surveys were statistically analyzed using lower-hemisphere equal-area stereonets to assess dominant orientations for joint sets and bedding. The average bedding from only geologic mapping measurements is 04°, 122° (dip, dip direction) or N32°E dipping 4°SE (quadrant strike/dip).

Up to four different joint sets formed due to tectonic stresses on the bedrock. These joint sets can be classified as dip, strike, or oblique joints. Dip joints form parallel to bedding dip direction and are typically perpendicular to fold axes, representing extension that is perpendicular to the maximum principal stress direction or direction of compression. These joints are commonly near vertical. Strike joints develop parallel to the strike of bedding and fold axes, typically forming from tension along fold hinges. The dip direction and angle of these joints is nearly orthogonal to the dip direction and angle of bedding. Oblique joints commonly develop diagonal (± 30°) to the principal stress direction and represent conjugate sets formed from shear. An additional joint set is present at the Site that is subparallel to bedding, which is interpreted to represent exfoliation or spheroidal weathering of the rock mass. The most prominent joint sets can be grouped into the following orientations:

- Joint Set 1 (dip joint): 88°, 195°
- Joint Set 2 (strike joint): 90°, 318°
- Joint Set 3: rotated 81°, 221° to 82°, 248°
- Joint Set 4 (subparallel bedding): 06°, 167

The Pottsville aquifer system underlies the Site. The Pottsville aquifer system is composed primarily of Pennsylvanian-age sandstones, shales, conglomerates, and coal. Groundwater flow primarily occurs through coal seams or rock fabric discontinuities such as bedding planes and fractures. Groundwater in the Pottsville aquifer system is commonly regarded as confined due to large permeability contrasts within the aquifer (Stricklin, 1989). Recharge to the Pottsville formation is largely through infiltration of precipitation and to a lesser extent, downward seepage of river water at hydraulically favored locations.

Regionally, recharge is accommodated largely by fracture enhanced permeability. Major recharge zones to the Pottsville Formation are related to major geologic structures such as large fault zones or along

systematic fold axes (Pashin, 2007). Although the Pottsville aquifer system is the primary aquifer in Walker County, groundwater use is relatively limited. According to O'Rear et al., 1972, groundwater use accounted for approximately 15% of total water use in Walker County in 1966. By 2005, groundwater use had declined to less than 1% of total water use in Walker County, or 1.14 million gallons per day (mgd) of groundwater out of a total water use of 969.5 mgd (United States Geological Survey (USGS), 2005).

### 2.1.3 Pottsville Formation – Rock Chemistry

Published data indicate that elevated arsenic concentrations occur in the Southern Appalachian coal strata where Site monitoring wells are screened. Numerous publications document elevated trace metals in Pottsville and Pottsville coal strata (Kolker et al., 1999, Diehl et al., 2004, Goldhaber et al., 2002). For instance, according to the USGS National Coal Data System (NRCDS), the average concentration of arsenic (72 ppm) in the Pottsville coal strata is three times that of the average of other coal basins (Bragg et al., 1997). Of the US coal analyses for arsenic that are at least three standard deviations above the mean, approximately 90% are from the coal fields of Alabama (Diehl et al., 2004). The United States Geological Survey (USGS) maintains an inventory of coal quality that includes trace metal concentration data. It shows an arsenic concentration range of 1.08 mg/kg to 611.0 mg/kg for Walker County coals, with a mean of 47 mg/kg. For Jefferson County, the USGS Coal Quality Database showed an arsenic concentration range of 1.22 mg/kg to 122 mg/kg with a mean of 36 mg/kg in Pratt, Gillespy-Curry, and Mary Lee Coal Groups in the vicinity of Plant Miller.

Similarly, 75 Pratt Coal Group samples (Pratt, Nickel Plate, and American Coal Seams) analyzed by the USGS and inventoried in the USGS National Coal Resource Data System (NRCDS) showed the following ranges of other trace metals:

- Boron – 6.3 to 83.6 ppm (average of 35 ppm).
- Cobalt – 1.6 to 19.8 ppm (average of 8 ppm).
- Molybdenum – 0.8 to 22.2 ppm (average of 5 ppm).
- Lithium – 1.4 to 128 ppm (average of 28 ppm).

Bulk geochemical analyses of Pottsville stratigraphy from Plant Miller were conducted on recovered core. The data reflect arsenic concentrations between 4.4 mg/kg and 64.6 mg/kg in Pottsville core analyzed. Similarly, 21 Pottsville samples collected from the Site provided the following ranges of other trace metals:

- Boron – 10.3 to 92.8 ppm (average of 37 ppm).
- Cobalt – 5.4 to 21.2 ppm (average of 12 ppm).
- Molybdenum – non-detect to 1.9 ppm (average of 0.6 ppm).

Trace metal enrichment and pyrite origins have been linked to post-depositional (post-coalification) deformation and trace metal laden hydrothermal fluids upwelling during Alleghenian tectonism. Diehl et al., (2004) and Goldhaber et al., (2002) describe "high-pyrite" coals as a source of elevated arsenic and other trace metals. In these publications, pyrite occurrence is observed within coal banding, woody cellular fill structures, mineral overgrowths, and structural fills such as veins and microfaults.

### 2.1.4 Uppermost Aquifer

The Pottsville aquifer is the uppermost aquifer beneath the Site. Groundwater occurs in the Mary Lee, Gillespy, and Pratt Coal Groups of the Upper Pottsville Formation beneath the Site. The Mary Lee Coal Group is the uppermost aquifer north of the Ash Pond, the Gillespy Coal Group and Gillespy-Pratt transition zone are the uppermost aquifers beneath the north-central portion of the Ash Pond, and the Pratt Coal Group is the uppermost aquifer beneath the southern portion of the pond. The primary sources of groundwater in the uppermost aquifer are: (1) coal seams, (2) rock fractures or zones of fracture enhanced permeability, and to a lesser extent (3) bedding plains. Wells were generally screened across coal seams or groundwater yielding fractures. Depth to groundwater-producing zones were highly variable at the Site and generally ranged from 30 to 300 feet below ground surface (BGS).

Based on published data, groundwater quality produced from the Pottsville Formation can be characterized by high concentrations of sulfate, iron, and other trace metals (Jennings and Cook, 2010). Trace metals in Pottsville Formation groundwater are associated with sulfide minerals contained in organic-rich strata (e.g., Mudstones and Coal Seams) and siliceous/carbonate healed fractures and joints. Trace element enrichment is likely the result of migrating hydrothermal fluids generated during the late Paleozoic Allegheny orogeny (Diehl et al., 2005). Arsenic, antimony, molybdenum, selenium, copper, thallium, and mercury are elevated in Warrior Basin coal strata (Goldhaber et al., 2002).

### 2.1.5 Flow Interpretation

Groundwater flow is accomplished primarily by means of fracture flow, where groundwater flows along more conductive secondary discontinuities in the rock mass such as weaknesses along bedding planes,

joints, or cleat fabric in coal seams. Fractures at the Site are typically high-angle/near vertical (80° to 90°). Fracture flow in complex geologic media such as the heterogenous Pottsville Formation can be complex. Groundwater in the Pottsville aquifer is most commonly regarded as confined due to large permeability contrasts within the aquifer (Stricklin, 1989). The Pottsville at the Site is probably better described as a series of discrete, confined to semi-confined, groundwater yielding zones where groundwater elevations can vary significantly laterally and vertically and are governed by the heterogeneity of the lithology and degree of fracture network interconnectivity.

Potentiometric data suggests that following groundwater flow patterns and characteristics:

**Mary Lee Aquifer:** (1) North to south and (2) west to east towards the Ash Pond; groundwater likely flowing towards underground Mary Lee Mine (patterns observed in both upper Mary Lee Group and slightly lower across Mary Lee Coal Seam). Likely confined from Ash Pond by 200 to 300 feet of low permeability strata.

**Gillespy-Pratt Transition Zone:** Radial flow pattern emanating from east-northeastern portion of ash pond; strongest gradients appear to the southeast and then east towards adjacent Pratt Coal Mine; wells to northeast (saddle dike area) appear lateral (side-gradient) to groundwater flow pattern.

**Pratt Coal Group:** Radial flow pattern emanating from southeastern portion of the ash pond; strongest gradients appear to the southeast and then east towards adjacent Pratt Coal Mine; vertical groundwater separation of 3 to 8 feet generally exists between Pratt and American coal seams (discrete flow zones within Pratt Coal Group).

## 2.2 GROUNDWATER MONITORING SYSTEM

Pursuant to § 257.91 and ADEM Admin. Code r. 335-13-15-.06(2), Plant Miller has installed a groundwater monitoring system to monitor groundwater within the uppermost aquifer. The certified groundwater monitoring system for the Ash Pond is designed to monitor groundwater passing the waste boundary of the CCR unit within the uppermost aquifer. Wells were located to serve as upgradient and downgradient monitoring locations based on groundwater flow direction as determined by the potentiometric surface elevation contour maps. All groundwater monitoring wells were designed and constructed using "Design and Installation of Groundwater Monitoring Wells in Aquifers," ASTM Subcommittee D18.21, as a

guideline. As required by § 257.90(e) and ADEM Admin Code r. 335-13-15-.06(1)(f), the following also describes monitoring related-activities performed during the preceding year.

### 2.2.1 Monitoring Wells

The current detection and compliance groundwater monitoring network comprises 26 monitoring wells. Historically, the groundwater monitoring network has comprised 24 monitoring wells. In 2020, ash pond closure activities necessitated the abandonment and relocation of nine downgradient compliance locations. A plan for the abandonment and relocation of the nine monitoring wells (MR-AP-MW-7S, MR-AP-MW-7D, MR-AP-MW-8S, MR-AP-MW-8D, MR-AP-MW-9S, MR-AP-MW-9D, MR-AP-MW-13S, MR-AP-MW-13D, and MR-AP-MW-14) was submitted to ADEM in February 2020 and approved in May 2020. A revised work plan provided additions to the original scope of work to include the abandonment and reinstallation of three previously installed horizontal delineation wells re-designated as piezometers (MR-AP-MW27H, MR-AP-MW-29H, and MR-AP-MW-36H) and the installation of one additional upgradient well location (MR-AP-MW-22). Additionally, the plan included a reduction of the number of monitoring well relocations from nine to seven. Replacement locations for MR-AP-MW-8S/8D and MR-AP-MW-9S/9D were consolidated into one paired location (MR-AP-MW-09SR/DR).

The abandonment of the 9 downgradient monitor wells, 3 horizontal delineation wells re-designated as piezometers, and installation of 10 replacement wells occurred between June and August 2020. Nine of the 10 new wells produced sufficient groundwater to be developed and were sampled during the October semi-annual monitoring event as part of the semi-annual assessment groundwater monitoring program. One replacement horizontal delineation well (MR-AP-MW-29HR) was abandoned due to the presence of predominately mine spoils.

Additionally, four additional upgradient monitoring wells were installed for purposes of establishing background groundwater quality data for the monitored groundwater flow regimes within the Pottsville Formation at the Site.

Monitoring well locations are presented on **Figure 5A, Monitoring Well Location Map (First Semi-Annual Monitoring Event) and Figure 5B, Monitoring Well Location Map (Second Semi-Annual Monitoring Event)**. **Table 1**, **Groundwater Monitoring Well Network Details**, and **Table 2, Monitoring Well and Piezometer Abandonment Details** summarize the monitoring well construction details and design purpose for the Plant Miller Ash Pond. The boring logs, well installation logs, and

development logs are included as **Appendix A**, **Monitoring Well Installation Data.** The abandonment report is included in **Appendix B, Monitor Well Abandonment Report**.

#### 2.2.1.1 Upgradient Wells

As described in **Sections 2.1.4 and 2.1.5** there are multiple groundwater flow regimes within the Pottsville Formation at the Site. Groundwater flow systems, as evaluated by potentiometric data, appear to have radial flow components away from the Site, and are not suitable for upgradient designations. The exception to this pattern may be the Mary Lee flow system, where recent potentiometric surface data (2020 monitoring events) indicate groundwater flow towards the ash pond. Additionally, the Gillespy-Pratt Transition Zone and Pratt Coal Group, where the majority of downgradient wells are screened, do not exist in the vicinity of the Site (and the majority of the Warrior Basin) due to mining or lithology being absent (strata projects above ground surface). Therefore, there is little opportunity for installing upgradient locations in these areas.

Background groundwater quality data for the monitored formations is provided by wells GS-AP-MW-8 and GS-AP-MW-13 installed at the nearby Plant Gorgas Ash Pond. These locations are suitable as upgradient locations due to (1) placement in similar geology and (2) screened intervals at these wells monitor recharging groundwater that has not been impacted by either Site. Well GS-AP-MW-13 is no longer in service and sampled, but the historical background database will continue to be used in background calculations. This well is installed at an elevation above the level of the Gorgas Ash Pond and exhibits a groundwater elevation approximately 30 feet higher than the Plant Gorgas Ash Pond; therefore, this well represents younger groundwater infiltrating the Pottsville and captures the natural geochemical variability within the formation.

Appendix III (detection monitoring parameters) constituent concentrations along with select other Appendix IV CCR indicator parameters were also evaluated as further basis for designating locations GS-AP-MW-8, GS-AP-MW-13, and GS-AP-MW-17V as upgradient. In general, concentrations of CCR indicator parameters reported for these well locations are well below published Groundwater Protection Standards (GWPS), downgradient wells, and pore-water (source) concentrations. The absence of elevated concentrations of CCR indicator parameters indicates younger, recharging groundwater and groundwater that has not been impacted by groundwater flowing away from the Ash Pond. These data, along with

groundwater elevation data, support an upgradient designation for locations GS-AP-MW-8, GS-AP-MW-13, and GS-AP-MW-17V.

Six additional upgradient locations (closer to the Site) have been installed: MR-AP-MW-21 and MR-AP-MW-23 in 2019 and MR-AP-MW-22S, MR-AP-MW-22I, MR-AP-MW-22D, and MR-AP-MW-23A in 2020. These six additional upgradient monitoring wells are located approximately 2 miles WNW of Plant Miller. These locations were chosen based on their similar positions on the Sequatchie Anticline and APC land ownership. These locations sit on the opposite limb of the Sequatchie Anticline, but at similar elevation, structural, and stratigraphic setting.

The additional upgradient wells were installed during Phase I and Phase II delineation activities for further evaluation and comparison with downgradient compliance and delineation wells at the Site. Upgradient location MR-AP-MW-23A was paired with monitor well MR-AP-MW-23 to determine if bentonite seal or grout contamination occurred during the installation of MR-AP-MW-23.

Stratigraphically, these upgradient well locations are screened in middle to lower-middle sections of the Mary Lee Coal Group. Based on the data reviewed, the Mary Lee Coal bed existed 60 to 120 feet above ground surface, so these wells installed between 47 and 200 feet below ground surface should correlate approximately to the Blue Creek through Jagger Coal horizons. Coal seams are noted at depths of approximately 66 feet BGS, 82 feet BGS, 104 feet BGS, 134 feet BGS, and 195 feet BGS. The most prominent coal seam occurs between 134 feet BGS and 137.5 feet BGS.

The additional upgradient monitoring wells were sampled during the October 2020 semi-annual monitoring event as part of the semi-annual assessment groundwater monitoring program. The boring logs, well installation logs, and development logs are included as **Appendix A**, **Monitoring Well Installation Data.**

#### 2.2.1.2 Downgradient Wells

Currently, the groundwater monitoring network comprises 20 downgradient monitoring wells installed along the boundary of the Ash Pond. Ash pond closure activities necessitated the abandonment of nine downgradient compliance locations. Seven of the nine downgradient compliance locations were replaced. The seven replacement wells (MR-AP-MW-7SR, MR-AP-MW-7DR, MR-AP-MW-9SR, MR-AP-MW-9DR, MR-AP-MW-13SR, MR-AP-MW-13DR, and MR-AP-MW-14R) were pre-surveyed in the field, ground elevations were compared between original and replacement well locations, and a target depth for

boring was pre-determined based on structural dip and the difference in ground elevation. The new groundwater wells were installed in water bearing zones as close to the wells being replaced as conditions warranted. The new wells were installed as close as feasible to the waste boundary of the CCR unit to (1) provide an accurate representation of the quality of groundwater passing the waste boundary and (2) not interfere with the closure construction activities or final cover system of the Plant Miller Ash Pond.

Borehole geophysics, hydrophysical logging, and occasional packer testing were used to determine well screen intervals. These logging techniques identify groundwater flow zones in open boreholes and are optimally suited for use in low-yielding, fractured rock media. Heat-pulse flowmeter logging or packer testing were often used to assess or further evaluate flow zones indicated by hydrophysical logging tools. If multiple flow zones were identified, then paired wells were often installed to screen both zones.

Preferential groundwater flow away from the Site, if existing, occurs within zones of enhanced permeability such as cleated coals or zones of intersecting rock discontinuities spatially located lateral to or beneath the base of the Ash Pond. Strata of the Gillespy-Pratt Coal Groups are the uppermost aquifer lateral to or beneath the base of the Ash Pond as indicated by borehole logging and geophysics in central and southern portions of the Site. To the north, Pratt Coal Group strata exist above ground surface or are absent. In these areas, downgradient monitoring well locations were installed across the first groundwater yielding fractures identified by borehole geophysics or within the deeper Mary Lee coal seam.

Monitoring well locations are presented on **Figure 5A** and **Figure 5B**. **Table 1**, **Groundwater Monitoring Well Network Details**, summarizes the monitoring well construction details and design purpose for the Ash Pond. The boring logs, well installation logs, and development logs are included as **Appendix A**, **Monitoring Well Installation Data.**

#### 2.2.1.3 Piezometers

There are currently three water-level only piezometers at the Site (MR-AP-MW-2V, MR-AP-MW-3V, and MR-AP-MW-19H). These locations were originally intended as delineation locations but did not yield sufficient groundwater for development or sampling and have been converted to piezometers. Previously installed delineation wells that did not yield sufficient groundwater for development were re-designated as piezometers. Delineation locations MR-AP-MW-27H, MR-AP-MW-29H, MR-AP-MW-31H, and MR-AP-MW-36H) were reassessed in a low-yield well study conducted in July 2020. Wells MR-AP-MW-27H and MR-AP-MW-36H were abandoned and replaced, well MR-AP-MW-29H was abandoned, and well MR-

AP-MW-31H was successfully redeveloped and sampled as part of the October semi-annual sampling event.

**Figure 5A, Figure 5B, and Table 1** summarize monitoring well construction details and design purpose for the Plant Miller Ash Pond.

#### 2.2.1.4 Delineation Wells

Pursuant to § 257.95(g)(1), ADEM Admin. Code r. 335-13-15-.06(6)(g), and Alabama Administrative Order AO 18-098-GW, additional monitoring wells were installed to characterize the horizontal and vertical extent of GWPS exceedances identified during assessment monitoring. Two horizontal delineation wells (MR-AP-MW-27HR and MR-AP-MW-36HR) were installed to replace previously installed delineation wells (MR-AP-MW-27H and MR-AP-MW-36H) that did not yield sufficient groundwater for development or sampling and one previously installed delineation well (MR-AP-MW-31H) was redeveloped and designated as from a piezometer to a horizontal delineation well. All three wells were sampled in October during the semi-annual sampling event.

Field work and sampling were conducted between July 2020 and October 2020. The Semi-Annual Progress Report summarizing findings from the most recent phases (Phase II and III) of delineation was submitted to ADEM on September 30, 2020.

A summary of well installation dates, location, elevation, screen interval, and purpose is provided in **Table 1 and Figures 5A/5B.** The boring logs, well installation logs, and development logs are included as **Appendix A**, **Monitoring Well Installation Data.**

#### 2.2.1.5 Monitoring Well Replacement and Abandonment

Ash pond closure activities necessitated the abandonment and relocation of nine downgradient compliance locations. A plan for the abandonment and relocation of the nine monitoring wells (MR-AP-MW-7S, MR-AP-MW-7D, MR-AP-MW-8S, MR-AP-MW-8D, MR-AP-MW-9S, MR-AP-MW-9D, MR-AP-MW-13S, MR-AP-MW-13D, and MR-AP-MW-14) was submitted to ADEM in February 2020 and approved in May 2020. A revised work plan added to the original scope of work to include the abandonment and reinstallation of three previously installed horizontal delineation wells re-designated as piezometers (MR-AP-MW27H, MR-AP-MW-29H, and MR-AP-MW-36H).

The abandonment of the nine downgradient monitor wells and three horizontal delineation wells re-designated as piezometers occurred between June and August 2020. One replacement horizontal delineation well (MR-AP-MW-29HR) boring was abandoned due to the presence of predominately mine spoils. The monitoring wells and boring were abandoned in accordance with Alabama well construction standards described in Administrative Code Div. 335-13 and the Alabama Environmental Investigation and Remediation Guidance (AEIRG; Revised 2017). The abandonment report is included in **Appendix B, Monitor Well Abandonment Report**.

#### 2.2.1.6 Monitoring Variances

The groundwater monitoring program at the Site is operating under a Variance granted by ADEM on April 15, 2019, to conform State monitoring requirements under the CCR rule to Federal requirements. The variance:

1. Retains boron as an Appendix III detection monitoring parameter and excludes it as an Appendix IV assessment monitoring parameter.
2. Authorizes the use of Federally-published GWPS of 0.006 milligrams per liter (mg/L) for cobalt; 0.015 mg/L for lead; 0.040 mg/L for lithium; and 0.100 mg/L for molybdenum in lieu of background where those levels are greater than background levels.

### 2.2.2 Groundwater Monitoring History

Background groundwater samples were collected from July 2016 to June 2017. Semi-annual groundwater monitoring was initiated at the Ash Pond in September 2017.

#### 2.2.2.1 Available Monitoring Data

In accordance with § 257.94(b) and ADEM Admin. Code r. 335-13-15-.06(5)(b), eight independent samples were collected from each background and downgradient well and analyzed for the constituents listed in Appendix III and IV prior to October 17, 2017. Background sampling was performed from July 2016 to June 2017. Groundwater sampling for the first detection monitoring event after the background period was performed in September 2017.

Based on results of the 2017 Annual Groundwater and Corrective Action Monitoring Report, APC initiated an assessment monitoring program on January 15, 2018. Pursuant to 40 CFR §257.95(a) and ADEM

Admin. Code r. 335-13-15-.06(6)(a), monitoring wells were sampled for all Appendix IV parameters in January 2018, within 90 days of initiating the assessment monitoring program. Semi-annual assessment sampling has continued with sampling events in May and October 2018, April-May and August-September 2019, and March and October 2020.

Any well installed for Site investigation and delineation subsequent to identifying statistical exceedances in groundwater data is incorporated into the semi-annual groundwater monitoring program.

Tables summarizing analytical data from all previous groundwater monitoring events are included in **Appendix C**, **Groundwater Analytical Data**.

#### 2.2.2.2 Historical Groundwater Flow

Historical groundwater elevations and potentiometric surface maps show that groundwater flow patterns are consistent across monitoring events. Downgradient wells indicate a radial flow pattern away from the Site within deeper rock units lateral to or below the base of the Ash Pond. Groundwater elevations fluctuate in response to rainfall. Seasonal variations of 1 to 10 feet are typical at the Site based on available monitoring data.

### 2.2.3 Groundwater Sampling and Analysis

As required by § 257.90(e) and ADEM Admin. Code r. 335-13-15-.06(1)(f), the following describes monitoring-related activities performed during the preceding year. As described in **Section 2.2.2.1**, the Site entered an Assessment Monitoring program pursuant to 40 CFR §257.95(a) and ADEM Admin. Code r. 335-13-15-.06(6)(a) in January 2018. Statistical evaluations of 2018 assessment monitoring data identified Appendix IV constituents above the GWPS at statistically significant levels (SSL) and the Site prepared an Assessment of Corrective Measures (ACM). Pursuant to § 257.95(g)(1), ADEM Admin. Code r. 335-13-15-.06(6)(g)2., and AO 18-098-GW, additional monitoring wells were installed to characterize the horizontal and vertical extent of GWPS exceedances identified during assessment monitoring. These wells, along with the compliance monitoring well network, are sampled semi-annually.

#### 2.2.3.1 Sampling Event Summary

Semi-annual assessment monitoring sampling events occurred in March and October 2020. Phase II delineation wells installed at the Site were sampled semi-annually for the first time during March 2020.

The downgradient, horizontal delineation replacement wells, and additional upgradient wells were sampled semi-annually for the first-time during October 2020.

Groundwater samples were analyzed for the full list of Appendix III and Appendix IV parameters during each assessment monitoring event. Analytical data from the groundwater monitoring events is included as **Appendix D, Laboratory and Field Records**, in accordance with the requirements of § 257.90(e)(3) and ADEM Admin. Code r. 335-13-15-.06(1)(f)3.

#### 2.2.3.2 Groundwater Sample Collection

Prior to recording water levels and collecting samples each well was opened and allowed to equilibrate to atmospheric pressure. Within a 24-hour period, depths to groundwater were measured to the nearest 0.01 foot with an electronic water level indicator with depth referenced from the top of the inner PVC well casing. Groundwater elevations were calculated by subtracting the depth to groundwater from surveyed top-of-casing (TOC) elevations.

Groundwater samples were collected from monitoring wells using low-flow sampling procedures in accordance with §257.93(a) and ADEM Admin. Code r. 335-13-15-.06(4)(a). All monitoring wells at Plant Miller are equipped with a dedicated pump. Monitoring wells were purged and sampled using low-flow sampling procedures. In this procedure, field water quality parameters (pH, turbidity, conductivity, and dissolved oxygen) are measured to determine stabilization and groundwater samples are collected when the following stabilization criteria are met:

- 0.2 standard units for pH.
- 5% for specific conductance.
- 0.2 Mg/L or 10% for DO > 0.5 mg/l (whichever is greater).
- Turbidity measurements less than 5 NTU.
- Temperature and ORP – record only, no stabilization criteria.

During purging and sampling, a SmarTroll instrument was used to monitor and record field parameters. Once stabilization was achieved, samples were collected and submitted to the laboratory following standard chain-of-custody (COC) protocol. Field data recorded in support of groundwater sampling activities for the monitoring events are included in **Appendix D**.

#### 2.2.3.3 Sample Preservation and Handling

Groundwater samples were collected within the designated size and type of laboratory-supplied containers required for specific parameters. Sample bottles were pre-preserved by the laboratory.

Where temperature control was required, samples were placed in an ice-packed cooler and cooled to less than 6 °C immediately after collection. Blue ice or other cooling packs were not used for cooling samples. An ice-packed cooler was on hand when samples were collected.

#### 2.2.3.4 Chain of Custody

A chain-of-custody (COC) record was used to track sample possession from the time of collection to the time of receipt at the laboratory. All samples were handled under strict COC procedures beginning in the field. COC records are included with the analytical laboratory reports included in **Appendix D**.

#### 2.2.3.5 Laboratory Analysis

Laboratory analyses was performed by the APC Environmental Laboratory (APCEL) in Calera, Alabama or Eurofins TestAmerica, Inc. (TAL), of Pensacola, Florida and St. Louis, Missouri. Both APCEL and TAL are accredited by National Environmental Laboratory Accreditation Program (NELAP) and maintain a NELAP certification for all parameters analyzed**. Table 3, Monitoring Parameters and Reporting Limits**, lists Assessment Monitoring constituents analyzed at the Site. Groundwater data and chain of custody records for the monitoring events are presented in **Appendix C** and **Appendix D**.

# 3.0 GROUNDWATER ELEVATIONS

## 3.1 GROUNDWATER ELEVATIONS AND FLOW

During the March 2020 sampling event, depths to water ranged from artesian to 301.04 feet below top of casing (ft BTOC) and groundwater elevations ranged from 425.40 to 144.04 ft MSL. During the October 2020 sampling event, depths to water ranged from artesian to 265.04 ft BTOC and groundwater elevations ranged from 423.32 to 150.69 ft MSL.

The following maps depict groundwater elevations and inferred groundwater flow direction during the March 2020 monitoring event: **Figure 6A, Potentiometric Surface Contour Map – Mary Lee Aquifer (March 2, 2020), Figure 6B, Potentiometric Surface Contour Map – Gillespy Lower Sandstone Unit (March 2, 2020), Figure 6C, Potentiometric Surface Contour Map – Gillespy Upper Sandstone Unit (March 2, 2020), Figure 6D, Potentiometric Surface Contour Map – Gillespy-Coal-Pratt Transition Zone (March 2, 2020), Figure 6E, Potentiometric Surface Contour Map – Pratt Coal Group (March 2, 2020)**, **and Figure 6F, Potentiometric Surface Contour Map – Upgradient Wells (April 9, 2020).**

The following maps depict groundwater elevations and inferred groundwater flow direction during the March 2020 monitoring event: **Figure 7A, Potentiometric Surface Contour Map – Mary Lee Aquifer (October 12, 2020), Figure 7B, Potentiometric Surface Contour Map – Gillespy Lower Sandstone Unit (October 12, 2020), Figure 7C, Potentiometric Surface Contour Map – Gillespy-Pratt Transition (October 12, 2020), Figure 7D, Potentiometric Surface Contour Map – Pratt Coal Group (October 12, 2020), Figure 7E, Potentiometric Surface Contour Map – Deep Upgradient Monitoring Wells (Middle-Lower Mary Lee Group) (October 12, 2020)**, **and Figure 7F, Potentiometric Surface Contour Map – Shallow Upgradient Monitoring Wells (Middle-Lower Mary Lee Group) (October 12, 2020).**

Potentiometric surface maps for the Site are subdivided into five flow systems based on hydrostratigraphy and vertical separation in groundwater. These vertical separations in groundwater elevations prominently display the confined to semi-confined conditions described in **Sections 2.1.2** and **2.1.4.** During a detailed review of the second semi-annual monitoring event, it was interpreted that Upper Gillespy and Pratt Transition flow systems can largely be grouped together as one flow system for the purposes of describing groundwater flow.

Groundwater elevations on **Figure 6E** and **7D** indicate the Pratt Group could be further subdivided (vertical separation between MW-8S/8D, 9S/9D, and 09SR/09DR pairs). These data also show vertical groundwater separation between coal seams in the Pratt Coal Group, indicating that confining or semi-confining conditions exist between these discrete flow intervals.

In general, it is inferred that laterally continuous zones that intersect or have communication with the Ash Pond through interconnected fractures will display radial flow patterns away from the Site and emanate near the stratigraphic intersection with the Ash Pond. Hydrostratigraphic intervals that do not intersect or that have poor to no hydraulic connection with the Ash Pond will display groundwater flow pattern consistent with topography or regional flow patterns. Other factors, such as the underground Mary Lee Mine, could influence deeper flow systems. As shown on **Figure 6A** and **7A**, wells tapping the Mary Lee Coal display groundwater elevations and flow towards the Ash Pond and towards the underground Mary Lee coal mine. Additional data evaluation and monitoring is needed to explore this observation.

A number of delineation wells monitor discrete zones or fractures exhibiting groundwater levels that do not appear connected to flow systems presented in **Figures 6A - 6E** and **Figures 7A - 7D** at the Site, and therefore were not used in potentiometric surfaces constructed for these flow systems. With the exception of piezometer MR-AP-MW-2V (middle Mary Lee Coal Group), these locations generally monitor discrete fracture flow intervals in middle to lower sections of the Gillespy Coal Group.

All available groundwater elevation data recorded since 2016 have been tabulated and included in **Table 4, Groundwater Elevation Summary**.

## 3.2 GROUNDWATER FLOW VELOCITY CALCULATIONS

Because the geology at the Ash Pond is not homogeneous or isotropic with respect to groundwater flow, groundwater velocity calculations using derivations of Darcy's Law are not applicable to groundwater at the Site. The hydrogeologic characteristics of fractured rock typically produce preferential groundwater flow paths, so groundwater velocity is much more variable than in uniform porous media such as sand. During monitoring well installation, multiple techniques were used to successfully intercept groundwater flow paths with the monitoring wells located around the Ash Pond. These flow paths correspond to coal cleats/fractures, zones of fracture concentration, bedding planes, and other discontinuities in the rock. Therefore, groundwater flow velocity at the Site cannot be accurately quantified using existing Site data.

Aquifer performance testing, including slug tests, has been conducted to characterize hydraulic conductivity values at the Site. Slug and packer testing provided horizontal hydraulic conductivities for the uppermost aquifer between $1.00 \times 10^{-3}$ cm/sec and $6.00 \times 10^{-7}$ cm/sec. Hydraulic conductivity in the uppermost aquifer typically ranges between $10^{-4}$ to $10^{-5}$ cm/sec with an average $6.15 \times 10^{-4}$ cm/sec.

The lowest estimated hydraulic conductivity value of $6 \times 10^{-7}$ cm/sec was derived from packer testing preformed at borehole MR-AP-MW-3D (interval 170 ft to 226 ft) and borehole MR-AP-MW-4 (interval 80 ft to137 ft). The measured recovery for these tests was on the order of 1%. This is indicative of a relatively closed system where fractures, if any, are poorly connected to the surrounding groundwater flow system. The complex lithostratigraphy, sharp permeability contrasts, and fractured nature of the Pottsville Formation contribute to vertical groundwater flow at the Site as well confining to semi-confining conditions evidenced in the spatial distribution of hydraulic heads.

# 4.0 EVALUATION OF GROUNDWATER QUALITY DATA

## 4.1 DATA VALIDATION – QUALITY ASSURANCE/QUALITY CONTROL

During each sampling event, quality assurance/quality control samples (QA/QC) were collected at a rate of one sample per every group of 10 well samples. Equipment blank and field blank samples were also collected during each sampling event.

Analytical precision is measured through the calculation of the relative percent difference (RPD) of two data sets generated from a similar source. Here, a comparison of results between samples and field duplicate samples are used as measure of laboratory precision. Where field duplicates are collected, the RPD between the sample and duplicate sample is calculated as:

$$RPD = \frac{Conc1 - Conc2}{(Conc1 + Conc2)/2}$$

Where:

RPD = Relative Percent Difference (%)

Conc1 = Higher concentration of the sample or field duplicate

Conc2 = Lower concentration of the sample or field duplicate

Where the relative percent differences below 20%, the difference is considered acceptable and no further action is needed. Where an RPD is greater than 20%, further evaluation is required to attempt to determine the cause of the difference and potentially result in qualified data. **Table 5, Relative Percent Difference Calculations,** provides the relative percent differences for sample and sample duplicates during 2020 sampling events. All RPD's were below 20% for the most recent sampling event.

Data from all equipment and field blanks were reviewed for purposes of QA/QC. All equipment and field blank data were below laboratory detection limits and data validation was not required.

## 4.2 STATISTICAL METHODOLOGY AND TESTS

The Sanitas Groundwater statistical software is used to perform the statistical analyses. Sanitas is a decision support software package that incorporates the statistical tests required of Subtitle C and D facilities by

EPA regulations. The analysis complies with the federal rule for the Disposal of Coal Combustion Residuals from Electric Utilities (CCR Rule, 2015) as well as with the USEPA Unified Guidance (2009).

### 4.2.1 Appendix III Evaluation

Intrawell prediction limits, combined with a 1-of-2 verification strategy, are used for pH to determine whether there has been a statistically significant increase (SSI) over background groundwater quality. Interwell prediction limits, combined with a 1-of-2 verification strategy, are used to evaluate boron, calcium, chloride, fluoride, sulfate, and TDS. Intrawell prediction limits use screened historical data within a given well to establish limits for parameters at that well. The most recent sample from the same well is compared to its respective background to identify SSIs over background. Interwell prediction limits pool upgradient well data to establish a background limit for an individual constituent. The most recent sample from each downgradient well is compared to the background limit to identify SSIs.

Groundwater Stats Consulting demonstrated that these test methods were appropriate in the October 2017 Statistical Analysis Plan, which was updated in August 2020 with additional data screening and evaluation. Time series plots were used to screen proposed background data for suspected outliers, or extreme values that would result in limits that are not conservative from a regulatory perspective. Suspected outliers at all wells for Appendix III parameters are formally tested using Tukey's box plot method and, when identified, flagged in the computer database.

The following adjustments are also part of the statistical analysis:

- No statistical analyses are required on wells and analytes containing 100% non-detects (EPA Unified Guidance, 2009, Chapter 6).
- When data contain <15% non-detects in the background, simple substitution of one-half the reporting limit is utilized in the statistical analysis. The reporting limit utilized for non-detects is the practical quantitation limit (PQL) as reported by the laboratory.
- When data contain between 15-50% non-detects the Kaplan-Meier non-detect adjustment is applied to the background data.

### 4.2.2 Appendix IV Evaluation

When in assessment monitoring, Appendix IV constituents are sampled semi-annually, and concentrations are compared to GWPS. Following the Unified Guidance, spatial variation for Appendix III parameters is tested using the ANOVA; this test is not prescribed for Appendix IV constituents. Unlike the statistical evaluation of Appendix III constituents (where single-sample results are compared to the statistical limit),

Appendix IV analysis uses the pooled results from each downgradient well to develop a well-specific Confidence Interval that is compared to the statistical limit. The statistical limit is either the Interwell Tolerance limit (i.e. background) calculated using the pool of all available upgradient well data (see Chapter 7 of the Unified Guidance), or an applicable groundwater protection standard such as the MCL. Appendix IV background data are screened for outliers and extreme trending patterns that would lead to artificially elevated statistical limits.

Parametric tolerance limits (i.e. UTLs) were calculated using pooled upgradient well data for Appendix IV parameters with a target of 95% confidence and 95% coverage. The confidence and coverage levels for nonparametric tolerance limits are dependent on the number of background samples. The UTLs were then used as the GWPS.

As described in 40 CFR § 257.95(h)(1)-(3) and the ADEM Variance (see section **2.2.1.6)**, the GWPS is:

(1) The maximum contaminant level (MCL) established under 40 CFR §§ 141.62 and 141.66.
(2) Where an MCL has not been established:
    (i) Cobalt 0.006 mg/l.
    (ii) Lead 0.015 mg/l.
    (iii) Lithium 0.040 mg/l.
    (iv) Molybdenum 0.100 mg/l.
(3) Background levels for constituents where the background level is higher than the MCL or rule-specified GWPS.

In assessment monitoring, when the Lower Confidence Limit (LCL), or the entire interval, exceeds the GWPS as discussed in the USEPA Unified Guidance (2009), the result is recorded as an SSL. Appendix IV constituents will be updated every 2 years beginning with the most recent event (Fall 2019). The next update to GWPS will occur no earlier than the Fall of 2021. Data from upgradient wells collected between updates may still be used to support ASDs if merited.

## 4.3 STATISTICAL EXCEEDANCES

Analytical data from the 2020 semi-annual monitoring events in March and October were statistically analyzed in accordance with the Professional Engineer (PE)-certified Statistical Analysis Plan (October 2017) and updated August 2020 performed by Groundwater Stats Consulting. Appendix III statistical analysis was performed to determine if constituents have returned to background levels. Appendix IV

assessment monitoring parameters were evaluated to determine if concentrations statistically exceeded the established groundwater protection standard.

### 4.3.1 Appendix III Constituents

Based on review of the Appendix III statistical analysis presented in **Appendix E, Statistical Analyses,** Appendix III constituents have not returned to background levels.

### 4.3.2 Appendix IV Constituents

**Table 6, Summary of Background Levels and Groundwater Protection Standards,** summarizes the background limit established at each monitoring well and the GWPS. A summary table of the statistical limits accompanies the prediction limits in **Appendix E.**

The following subsections describe statistical exceedances during 2020 monitoring events.

#### 4.3.2.1 First Semi-Annual Groundwater Monitoring Event

*Comparison with Published GWPS*

For this comparison, variance limits for non-MCL constituents are used, and data from newly installed upgradient wells (GS-AP-MW-17V, MR-AP-MW-21 and MR-AP-MW-23) were not factored in. During the first semi-annual monitoring event, statistical analysis of Appendix IV data incorporating limits defined in the 2019 ADEM Variance (section **2.2.1.6**) identified the following SSLs over GWPS at the listed downgradient wells:

- MR-AP-MW-1: Lithium.
- MR-AP-MW-2: Cobalt, Lithium.
- MR-AP-MW-3D: Arsenic, Lithium.
- MR-AP-MW-3S: Lithium.
- MR-AP-MW-4: Cobalt, Lithium.
- MR-AP-MW-5: Arsenic, Lithium.
- MR-AP-MW-6: Cobalt, Lithium.
- MR-AP-MW-7D: Lithium.
- MR-AP-MW-7S: Lithium.
- MR-AP-MW-9D: Cobalt, Lithium.

- MR-AP-MW-9S: Lithium.
- MR-AP-MW-10: Lithium.
- MR-AP-MW-11: Lithium.
- MR-AP-MW-12: Lithium.
- MR-AP-MW-13S: Cobalt, Lithium.
- MR-AP-PZ-5: Lithium.

**Table 7, First Semi-Annual Monitoring Event Analytical Summary**, provides a summary of all detected constituents for the first semi-annual sampling event. Statistical reporting output is included as **Appendix E.**

Limited groundwater analytical data is available for delineation wells installed at the site; therefore, groundwater quality is simply compared to the GWPS. Similar to above, this comparison includes variance limits for non-MCL constituents and does not include site-specific background derived GWPS. A review of analytical data derived from delineation wells revealed the following GWPS Exceedances for the first semi-annual sampling event:

- MR-AP-MW-6V: Arsenic.
- MR-AP-MW-17H: Lithium.
- MR-AP-MW-18H: Lithium.
- MR-AP-MW-19HA: Lithium.
- MR-AP-MW-20H: Lithium.
- MR-AP-MW-20HS: Lithium.
- MR-AP-MW-28H: Lithium.
- MR-AP-MW-30H: Lithium.
- MR-AP-MW-33H: Lithium.
- MR-AP-MW-34H: Lithium.
- MR-AP-MW-35H: Arsenic.
- MR-AP-MW-37H: Arsenic, Lithium.

Details regarding the installation and sampling of these wells, and future proposed actions as a result of these exceedances, were submitted to ADEM in a delineation report on May 13, 2019 and subsequent progress updates submitted in September 2019 and March 2020.

*Comparison with Site Background*

During the first semi-annual monitoring event, Appendix IV data were compared to background concentrations from newly installed upgradient wells MR-AP-MW-21 and GS-AP-MW-17V. Upgradient location MR-AP-MW-23 was not included in the comparison because this location was being evaluated for potential bentonite seal or grout contamination (see Section 4.3.2.2).

As detailed in the revised groundwater monitoring plan submitted in April 2020, data from these wells will be evaluated for inclusion in the derivation of updated site-specific GWPS after a minimum of four background sampling events. Using concentrations from the first three sampling events as a guide for site-specific background concentrations, the following SSLs were identified over GWPS at the listed downgradient wells:

- MR-AP-MW-1: Lithium.
- MR-AP-MW-2: Cobalt, Lithium.
- MR-AP-MW-3D: Arsenic, Lithium.
- MR-AP-MW-3S: Lithium.
- MR-AP-MW-4: Cobalt, Lithium.
- MR-AP-MW-5: Arsenic, Lithium.
- MR-AP-MW-6: Cobalt, Lithium.
- MR-AP-MW-7D: Lithium.
- MR-AP-MW-7S: Lithium.
- MR-AP-MW-9D: Cobalt, Lithium.
- MR-AP-MW-9S: Lithium.
- MR-AP-MW-10: Lithium.
- MR-AP-MW-11: Lithium.
- MR-AP-MW-12: Lithium.
- MR-AP-MW-13S: Cobalt, Lithium.
- MR-AP-PZ-5: Lithium.

The primary difference between the comparison using published GWPS and those based on background is the increased GWPS for lithium with the inclusion of site background and new upgradient well location GS-AP-MW-17V. This increased GWPS (from 0.04 to 0.0809 mg/L) reduces the number of lithium exceedances. As described in section **2.1.3,** lithium can occur naturally at elevated concentrations in

Pottsville Sequences and ranged from 1.4 to 128 mg/L (average of ~ 28 mg/L) in Pratt Coal Group strata queried from the NRCDS.

#### 4.3.2.2 Second Semi-Annual Groundwater Monitoring Event

*Comparison with Published GWPS*

For this comparison, variance limits for non-MCL constituents are used, and data from newly installed upgradient wells (GS-AP-MW-17V, MR-AP-MW-21, MR-AP-MW-23, MR-AP-MW-23A, MR-AP-MW-22S, MR-AP-MW-22I, and MR-AP-MW-22D) were not factored in. Statistical analysis of Appendix IV data identified the following SSLs over GWPS at the listed wells:

- MR-AP-MW-1: Lithium.
- MR-AP-MW-2: Cobalt, Lithium.
- MR-AP-MW-3D: Lithium.
- MR-AP-MW-3S: Lithium.
- MR-AP-MW-4: Cobalt, Lithium.
- MR-AP-MW-5: Arsenic, Lithium.
- MR-AP-MW-6: Cobalt, Lithium.
- MR-AP-MW-10: Lithium.
- MR-AP-MW-11: Lithium.
- MR-AP-MW-12: Lithium.
- MR-AP-PZ-5: Lithium.

**Table 8, Second Semi-Annual Monitoring Event Analytical Summary**, provides a summary of all detected constituents for the second semi-annual sampling event. Statistical reporting output is included as **Appendix E.**

**Delineation Wells**

Limited groundwater analytical data is available for delineation wells installed at the site; therefore, groundwater quality is simply compared to the GWPS. A review of analytical data derived from delineation wells revealed the following GWPS Exceedances for the second semi-annual sampling event:

- MR-AP-MW-4V: Lithium.
- MR-AP-MW-6V: Lithium.
- MR-AP-MW-17H: Lithium.

- MR-AP-MW-18H: Lithium.
- MR-AP-MW-19HA: Lithium.
- MR-AP-MW-20H: Lithium.
- MR-AP-MW-20HS: Lithium.
- MR-AP-MW-27HR: Lithium.
- MR-AP-MW-28H: Lithium.
- MR-AP-MW-30H: Lithium.
- MR-AP-MW-31H: Lithium.
- MR-AP-MW-33H: Cobalt, Lithium.
- MR-AP-MW-34H: Lithium.
- MR-AP-MW-35H: Arsenic.
- MR-AP-MW-36HR: Lithium.
- MR-AP-MW-37H: Lithium.

**Newly Installed Downgradient Wells**

Limited groundwater analytical data is available for newly installed downgradient wells installed at the site; therefore, groundwater quality is simply compared to the background well concentrations. A review of analytical data derived from delineation wells revealed the following GWPS exceedances for the second semi-annual sampling event:

- MR-AP-MW-7SR: Lithium.
- MR-AP-MW-7DR: Lithium.
- MR-AP-MW-9SR: Lithium.
- MR-AP-MW-9DR: Lithium.
- MR-AP-MW-13SR: Cobalt, Lithium.

As described in **Section 2.2.1.1**, recent potentiometric surface maps for the Mary Lee Aquifer suggest potential for groundwater flow towards the ash pond (**Figures 6A** and **7A**). In this scenario, downgradient and delineation wells screened across or proximal to the Mary Lee coal (MR-AP-MW-1, MR-AP-MW-2, MR-AP-PZ-5, MR-AP-MW-19HA, MR-AP-MW-34H, and MR-AP-MW-35H) might not be impacted by the ash pond, and elevated concentrations would be reflective of natural conditions and geochemistry.

Details regarding the installation and sampling of these wells, and future proposed delineation as a result of these exceedances, were submitted to ADEM in the Plan Miller Groundwater Investigation Report on

May 13, 2019. **Table 8 Second Semi-Annual Monitoring Event Analytical Summary**, provides a summary of all detected constituents for the second semi-annual sampling event.

*Comparison with Site Background*

During the second semi-annual monitoring event, Appendix IV data were compared to background concentrations from newly installed upgradient wells GS-AP-MW-17V, MR-AP-MW-21, MR-AP-MW-23, MR-AP-MW-22S, and MR-AP-MW-22I. As detailed in the revised groundwater monitoring plan submitted in April 2020, data from these wells will be evaluated for inclusion in the derivation of updated site-specific GWPS after a minimum of four background sampling events. Using concentrations from the first three sampling events as a guide for site-specific background concentrations, the following SSLs were identified over GWPS at the listed downgradient wells:

- MR-AP-MW-2: Cobalt, Lithium.
- MR-AP-MW-3D: Arsenic.
- MR-AP-MW-3S: Lithium.
- MR-AP-MW-4: Cobalt.
- MR-AP-MW-5: Arsenic, Lithium.
- MR-AP-MW-10: Molybdenum
- MR-AP-MW-11: Lithium.
- MR-AP-MW-12: Molybdenum

**Delineation Wells**

Limited groundwater analytical data are available for delineation wells installed at the site; therefore, groundwater quality is simply compared to the background well concentrations. A review of analytical data derived from delineation wells revealed the following exceedances for the second semi-annual sampling event:

- MR-AP-MW-18H: Lithium.
- MR-AP-MW-19HA: Lithium.
- MR-AP-MW-20H: Lithium.
- MR-AP-MW-33H: Cobalt.
- MR-AP-MW-35H: Arsenic.

As described in **Section 2.2.1.1**, recent potentiometric surface maps for the Mary Lee Aquifer suggest potential for groundwater flow towards the ash pond (**Figures 6A** and **7A**). In this scenario, wells screened across or proximal to the Mary Lee coal (MR-AP-MW-1, MR-AP-MW-2, MR-AP-PZ-5, MR-AP-MW-19HA, MR-AP-MW-34H, and MR-AP-MW-35H) might not be impacted by the ash pond, and elevated concentrations would be reflective of natural conditions and geochemistry.

**Newly Installed Downgradient Wells**

Limited groundwater analytical data are available for newly installed downgradient wells installed at the site; therefore, groundwater quality is simply compared to the background well concentrations. A review of analytical data derived from delineation wells revealed the following GWPS Exceedances for the second semi-annual sampling event:

- MR-AP-MW-13SR: Cobalt.

Upgradient locations MR-AP-MW-22D, MR-AP-MW-23 and MR-AP-MW-23A were not included in the comparison. As previously discussed, well MR-AP-MW-23 was thought to be possibly grout contaminated. Well MR-AP-MW-23A was installed adjacent to MR-AP-MW-23 to further explore potential grout contamination. If concentrations in well MR-AP-MW-23A returned significantly lower concentrations, then suspected grout contamination would likely be confirmed. However, sampling results from well MR-AP-MW-23A installed adjacent to MR-AP-MW-23 for comparison provided similar chemical results. Therefore, it appears these locations are not grout contaminated, and likely represent natural but older groundwater discharging along a geologic structure or preferential pathway. At this time, chemistry results from these two wells, along with MR-AP-MW-22D, are not included in site background comparisons. Geochemical signatures from an apparent older groundwater source need to be more fully evaluated for potential inclusion as upgradient wells.

## 5.0 MONITORING PROGRAM STATUS

The Site is currently in assessment monitoring and evaluating groundwater corrective action alternatives described in the ACM. In accordance with § 257.94(e) and ADEM Admin. Code r. 335-13-15-.06(5)(e), APC implemented assessment monitoring in January 2018. SSIs of Appendix III and SSLs of Appendix IV parameters were identified at the Plant Miller Ash Pond during sampling events conducted in 2018. ASDs were not completed for Appendix IV constituents exceeding the GWPS; therefore, pursuant to § 257.95(g)(3)(i) and ADEM Admin. Code r. 335-13-15-.06(6)(g)4.(i), APC completed an ACM in accordance with § 257.96, ADEM Admin. Code r. 335-13-15-.06(7), and ADEM Administrative Order AO 18-098-GW.

## 6.0 EVALUATION OF GROUNDWATER CORRECTIVE MEASURES

As required by the Administrative Order, MNA was proposed as the main corrective action remedy for the Site. Source control measures consisting of consolidation, dewatering, and capping of the ash (source) were already planned as part of pond closure.

Additional assessment work was completed in 2020 to evaluate and demonstrate MNA and geochemical manipulation as corrective measures at the Site. Groundwater samples and solids (precipitates) were collected from select wells, and groundwater sampling results were used to perform geochemical modeling, which predicted attenuating species under Site geochemical conditions. Well solids were analyzed to determine attenuating phases for the constituents of interest (COI; arsenic, cobalt, and lithium) at the Site. Solids analysis also provides insight into the stability of the attenuating mechanisms. The well solids were analyzed as follows:

- Elemental analysis by X-ray fluorescence (XRF) to determine the chemical composition of the matrix (e.g., iron compounds, aluminosilicates, and carbonates) and presence of COI.
- X-ray diffraction (XRD) to determine crystalline mineral phases.
- Scanning electron microscopy (SEM) and associated elemental analysis to confirm mineral phases and attenuating mechanisms .
- Selective sequential extraction (SSE) to determine the association of COI with attenuating phases and the relative binding strength of attenuated COI, and to provide a sense of permanence.

In the previous reporting period (January through June 2020), the following field and laboratory investigations were performed:

- Evaluated groundwater analytical data (primarily graphing) to look for evidence of natural attenuation occurring in space and time.
- Collected groundwater samples from background and impacted wells and performed a complete chemical analysis on the samples to enable groundwater geochemical modeling and the development of a geochemical conceptual site model (CSM).
- Performed geochemical modeling using the U.S. Geological Survey (USGS) computer program PHREEQC with the WATEQ4F thermodynamic database.
- Collected precipitate samples from the bottom of monitoring wells.
- Analyzed precipitate samples by XRF and XRD.

The following investigations began in the previous reporting period and were completed in the current reporting period:

- SEM to directly observe attenuating mineral phases.

- SSE to determine association of COI with attenuating phases, determine relative strength of attenuation, and provide a sense of permanence.
- CEC to assess ion exchange as an attenuation mechanism.

Work performed since the completion of the June 2020 progress report includes the following:

- Installing replacement downgradient monitoring wells, replacement horizontal delineation wells, and upgradient monitoring wells, and sampling monitoring wells.
- Completing SEM, SSE, and CEC testing on well solids samples.
- Analyzing and synthesizing the laboratory data described above to develop a geochemical CSM and to evaluate MNA and geochemical manipulation.
- Conceptualizing other corrective action options in the context of site-specific conditions, if MNA or geochemical manipulation does not perform as expected.
- Cation exchange capacity (CEC) and exchangeable COI concentrations for samples that contain clay minerals.

## 6.1 PRELIMINARY DATA ANALYSIS

Results from existing groundwater data analysis, geochemical modeling, and well solids analyses provide evidence for attenuation mechanisms for arsenic, cobalt, and lithium. The attenuating mechanisms identified include sorption on or coprecipitation in iron oxides (arsenic and cobalt), precipitation of barium arsenate (arsenic), and cation exchange on clays (cobalt and lithium).

Concentrations versus time and concentration versus distance graphs, laboratory analyses, and geochemical equilibrium modeling were used to develop an initial geochemical conceptual site model, including probable attenuating mechanisms for arsenic, lithium, and cobalt, and the relative stability of those mechanisms. The initial CSM for the Site is as follows:

- Multiple lines of evidence for arsenic, cobalt, and lithium attenuation.
- Moderately reducing, weakly acidic groundwater conditions.
- Redox buffered by iron oxide equilibria.
- Arsenic attenuation by sorption to iron oxides and possibly precipitation of barium arsenate.
- Cobalt attenuation by adsorption on and co-precipitation with iron oxides.
- Lithium attenuation by ion exchange on clay minerals.

As supported by SSE results and the scientific literature, incorporation of arsenic and cobalt into iron minerals, arsenic into barium arsenate, and lithium on clay minerals are relatively stable attenuation mechanisms. Data collected and available during the publication of this report are included as **Appendix F, MNA Evaluation – Geochemical Lab Data.**

## 7.0 SUMMARY AND CONCLUSIONS

Semi-annual assessment monitoring events took place in March and October 2020. Statistical evaluations of the 2020 assessment monitoring data identified SSLs of Appendix IV constituents above the GWPS. The site remains in assessment monitoring while groundwater corrective remedies are being evaluated. Additional monitoring wells were installed to assess the horizontal and vertical extent of groundwater impacts at the site. The results of this investigation were submitted to ADEM in May 2019. Additional details on delineation efforts were provided in subsequent semi-annual progress reports in September 2019, March 2020, and September 2020. The September 2020 semi-annual progress report included details relating to the abandonment and replacement of downgradient monitor wells impacted by closure construction activities and the installation of four additional upgradient monitor wells. These additional monitoring wells will continue to be sampled and analyzed as part of the ongoing assessment monitoring program.

An ACM was completed on June 12, 2019 to address SSLs of Appendix IV above groundwater protection standards.

The following future actions will be taken or are recommended for the site:

- Collect additional data to further evaluate remedies selected as feasible for the remediation of arsenic, cobalt, and lithium as described in the ACM.
- Review and research potential for additional upgradient locations targeting the Upper Gillespy Coal Group or coal seams of the Pratt Coal Group (regionally on APC-owned lands).
- Continue to compare site-specific corrective actions to the evaluation criteria in the CCR Rule, with emphasis on deficiencies that could eliminate a corrective action from further consideration.
- Continue to determine how corrective actions could be integrated with pond closure, such as dewatering and associated water treatment systems.
- Develop plans for additional Site investigations and associated laboratory work to determine MNA capacity, rates, and stability; and plans for laboratory treatability and/or field pilot tests to determine the effectiveness of geochemical manipulation as needed.
- Perform laboratory treatability studies and implement field pilot tests as needed.
- Submit the next Semi-Annual Progress Report by March 30, 2021.
- Submit the next Semi-Annual Remedy Selection and Design Progress Report by June 12, 2021.
    - Conduct the first semi-annual assessment monitoring event in the first half of 2021 and submit the annual groundwater monitoring and corrective action report summarizing the findings to ADEM by July 31, 2021.

Notes:

1. Northing and easting are in feet relative to the State Plane Alabama West North America Datum of 1983.
2. Elevations are in feet relative to the North American Vertical Datum of 1988.
3. Top of screen and bottom of screen depths are calculated relative to Top of Casing elevation and less the well sump length of 0.4’or 0.5'.
4. Monitor Wells GS-AP-MW-8, GS-AP-MW-13, and GS-AP-MW-17V are utilized as upgradient background wells for statistical data, GS-AP-MW-8 and GS-AP_MW-17V are sampled during the Plant Gorgas sampling event. Monitor well GS-AP-MW-13 was abandoned in July 2019 however historical data is still utilized for statistical comparison of groundwater quality.
5. Indicates delineation well that has been converted to piezometer due to low groundwater recharge.

**Table 1.**
**Groundwater Monitoring Well Network Details**

| Well Name | Purpose | Installation Completion Date | Northing [1] | Easting [1] | Ground Elevation [2] | Top of Casing Elevation [2] | Well Depth (ft.) Below Top of Casing | Top of Screen Elevation [2,3] | Bottom of Screen Elevation [2,3] | Screen Length |

**Table 6.**
**Summary of Background Levels and Groundwater Protection Standards**

| Analyte | Units | Background | GWPS |
|---|---|---|---|
| Antimony | mg/L | 0.003 | 0.006 |
| Arsenic | mg/L | 0.005 | 0.01 |
| Barium | mg/L | 0.189 | 2 |
| Beryllium | mg/L | 0.003 | 0.004 |
| Cadmium | mg/L | 0.001 | 0.005 |
| Chromium | mg/L | 0.01 | 0.1 |
| Cobalt | mg/L | 0.005 | 0.006 |
| Combined Radium-226/228 | pCi/L | 1.063 | 5 |
| Fluoride | mg/L | 0.2237 | 4 |
| Lead | mg/L | 0.005 | 0.015 |
| Lithium | mg/L | 0.05 | 0.05 |
| Mercury | mg/L | 0.0005 | 0.002 |
| Molybdenum | mg/L | 0.01 | 0.1 |
| Selenium | mg/L | 0.01 | 0.05 |
| Thallium | mg/L | 0.001 | 0.002 |

Notes:

1. mg/L - Milligrams per liter

2. pCi/L - Picocuries per liter

3. The background limits were used when determining the groundwater protection standard (GWPS) under 40 CFR §257.95(h) and ADEM Rule 335-13-15-.06(h).

| **MR-AP-MW-21** | **03-09-2020** | 0.101 | 52.4 | 14.6 | 0.285 | 7.7 | 111 | 496 |

Notes:

1. J value indicates the result is greater that or equal to the Method Detection Limit (MDL) and less that the Practical Quantitation Limit (PQL).
Values are displayed as less than the PQL with a J.

2. Non-Detect indicates the result was not detected above the MDL and is considered a non-detect.

3. U - Radium data is a combination of radium isotopes 226 and 228. When results are reported below the MDC (Minimum Detectable Concentration), data is displayed with an accompanying U. The MDC varies depending upon the sample amount and elapsed time of the measurment.

4. TDS - Total Dissolved Solids

Notes:

1. J value indicates the result is greater that or equal to the Method Detection Limit (MDL) and less that the Practical Quantitation Limit (PQL).
Values are displayed as less than the PQL with a J.

2. Non-Detect indicates the result was not detected above the MDL and is considered a non-detect.

3. U - Radium data is a combination of radium isotopes 226 and 228. When results are reported below the MDC (Minimum Detectable Concentration), data is displayed with an accompanying U. The MDC varies depending upon the sample amount and elapsed time of the measurment.

4. TDS - Total Dissolved Solids

Notes:

1. J value indicates the result is greater that or equal to the Method Detection Limit (MDL) and less that the Practical Quantitation Limit (PQL). Values are displayed as less than the PQL with a J.
2. Non-Detect indicates the result was not detected above the MDL and is considered a non-detect.
3. U - Radium data is a combination of radium isotopes 226 and 228. When results are reported below the MDC (Minimum Detectable Concentration), data is displayed with an accompanying U. The MDC varies depending upon the sample amount and elapsed time of the measurment.
4. TDS - Total Dissolved Solids

Notes:

1. J value indicates the result is greater that or equal to the Method Detection Limit (MDL) and less that the Practical Quantitation Limit (PQL).
Values are displayed as less than the PQL with a J.

2. Non-Detect indicates the result was not detected above the MDL and is considered a non-detect.

3. U - Radium data is a combination of radium isotopes 226 and 228. When results are reported below the MDC (Minimum Detectable Concentration), data is displayed with an accompanying U. The MDC varies depending upon the sample amount and elapsed time of the measurment.

4. TDS - Total Dissolved Solids

# Appendix B

## MONITOR WELL AND PIEZOMETER ABANDONMENT REPORT

Southern Company Services is including the following monitor well and piezometer abandonment report which documents the activities related to the abandonment of nine downgradient monitor wells and three horizontal delineation wells re-designated as piezometers for Alabama Power Company's Plant Miller located at 4250 Porter Road, Quinton, AL 35130-9471. Plant Miller is approximately fifteen miles northwest of Birmingham in western Jefferson County, Alabama. The plant occupies Sections 21, 22, 27, 28, 29, 32, 33, and 34, Township 16 South, Range 5 West and Section 4, Township 17 South, Range 5 West (Section/Township/Range data based on visual inspection of USGS topographic quadrangle maps and GIS plant boundary files provided by Southern Company) (USGS, 1982; USGS, 1983).

The Ash Pond is located east-southeast of the main plant, between the Mobile River and Plant Barry barge canal. **Figure 1, Site Location Map,** depicts the location of the Plant and Ash Pond with respect to the surrounding area.

Ash pond closure activities necessitated the abandonment and relocation of nine downgradient compliance locations. A plan for the abandonment and relocation of the nine monitoring wells (MR-AP-MW-7S, MR-AP-MW-7D, MR-AP-MW-8S, MR-AP-MW-8D, MR-AP-MW-9S, MR-AP-MW-9D, MR-AP-MW-13S, MR-AP-MW-13D, and MR-AP-MW-14) was submitted to ADEM in February 2020 and approved in May 2020. A revised workplan plan provided additions to the original scope of work to include the abandonment and reinstallation of three previously installed horizontal delineation wells re-designated as piezometers (MR-AP-MW27H, MR-AP-MW-29H, and MR-AP-MW-36H).

The abandonment of the nine downgradient monitor wells and three horizontal delineation wells re-designated as piezometers occurred between June and August 2020. Additionally, one replacement horizontal delineation well boring (MR-AP-MW-29HR) was abandoned due to the presence of predominately mine spoils and monitor well BY-AP-MW-22 (Deep) that was damaged during development activities. Subsequently, an offset boring, BY-AP-MW-22 (Deep)-ALT, was installed to replace the damaged well. The monitoring wells and boring were abandoned in accordance with Alabama well construction standards described in Administrative Code Div. 335-13 and the Alabama Environmental Investigation and Remediation Guidance (AEIRG; Revised 2017).

The boring and well installation logs, and well abandonment forms detailing abandonment activities have been included as Attachment A. The monitor wells, piezometers, and boring location are depicted on **Figure 5, Monitor Well Location Map**.

# Attachment A

# Well Abandonment Form

**PROJECT:**
Plant Miller Ash Pond CCR Wells

**WELL/HOLE NO.:** MR-AP-MW-7D

**DEPTH** 116.3 FEET
**HOLE DIAMETER:** 2 INCHES
**HOLE VOLUME:** 2.52 CUBIC FEET

**GEOLOGIST/ENGINEER**
Shannon H. McDonald, P.G.

**ABANDONMENT BY:**
SCS Drilling Services

**DATE ABANDONED:**
6/16/2020

**REASON FOR ABANDONMENT:**

New construction requirements; will be replaced.

**SEALANT TYPE:**
Neat Cement

**SEALANT MIXTURE RATIO:**
100

**SEALANT VOLUME USED:**
~36 gallons/4.81 cubic feet

**REMARKS:**

Water level at time of abandonment: 84.08' BMP. Well was tremie grouted to the surface with neat cement.

Project & Task Number: 175620204

Date: 8/11/2020

Goal/Task: Hydrogeologic Investigation

**Additional Remarks:**

1. Field crew removes bollards and well protection on 7/25/2020 to access MR-AP-MW27HR.
2. Greg Dyer and Greg Budd (SCS-ESEE) confirm MR-AP-MR27H is dry. Greg Budd (SCS-ESEE) notifies Michael McDonald (Stantec) that placing Halliburton HOLEPLUG 3/8"-inch Bentonite within well screen interval is not required (8/11/2020).
3. Well abandonment from 0.0 to 385.7 feet BGS completed on 8/11/2020. Approximately 66 gallons placed within screen and two-inch well casing.
4. Each grout mixture and grout surface return met the 10.0 lbs/gallon minimum.

# Monioring Well Abandonment Form

**General Information**

Project Name: Plant Miller – Phase III Delineation Monitoring Well Installation

Monitoring Well Number: MR-AP-MW-29H

Plant Name: Plant Miller

Plant Address: 4250 Porter Road Quinton, AL 35130

Abandoned by: Matthew Edmunds

Project & Task Number: 175620204

Date: 8/22/2020

Goal/Task: Hydrogeologic Investigation

**Well Details (Check one per section):**

| Casing Diameter | | Borehole Diameter | | Well Type | |
|---|---|---|---|---|---|
| x | 2" | x | 6" | x | Permanent |
| n/a | 4" | n/a | 7" | n/a | Temporary **- Bedrock boring. No well installed** |
| n/a | 7" | n/a | 12" | n/a | Geoprobe® Screen Point (GSP) or Equiv. |
| n/a | Other/NA | n/a | Other/NA | 383.5 ft | Measured Total Depth |
| | | | | Approx 160.0 ft | Measured Static Water Level |

Casing Material

x PVC (10-ft screen from 373.9' to 383.9')

n/a Steel

n/a Other **- No casing. Open bedrock boring.**

**Abandonment Details (Check one per section):**

*Refer to attached boring and well installation logs GS-GSA-MW-23V*

Abandonment Method (as detailed in SOW)

n/a Overdrill and Grout

n/a Well Extraction

x Grout in Place

n/a Bentonite Sealing-Pellets and Neat Cement

n/a Bentonite Sealing-Pellets only

n/a Probe Hole Grouting

n/a Re-proved for through-the-rod grouting

Materials and Quantity Used

n/a Type 1 Portland Cement mixed with 3-5% bentonite

n/a Bentonite Pellets

n/a Neat Cement

x Other **- Approx 70 gallons Aqua Guard Bentonite Grout**

Overdrilled Well Cuttings and Debris

n/a Staged Onsite for Disposal (covered top and bottom with poly-sheeting)

n/a Drummed for Disposal

Monitoring Well Number: MR-AP-MW-36H

Plant Name: Plant Miller

Plant Address: 4250 Porter Road Quinton, AL 35130

Abandoned by: Michael McDonald, PE

Project & Task Number: 175620204

Date: 8/5/2020 and 8/9/2020

Goal/Task: Hydrogeologic Investigation

**Additional Remarks:**

1. Field crew removes bollards and well protection. Greg Dyer (SCS-ESEE) confirms well screen between 285.7 to 305.7 feet BGS.
2. Water level at time of well screen abandonment: 210.15 feet BGS (8/5/2020)
3. Halliburton HOLEPLUG 3/8"-inch Bentonite placed from 280.5 to 305.7 feet BGS (8/5/2020).
4. Well abandonment from 0.0 to 280.5 feet BGS completed on 8/9/2020. Remaining grout placed using one-inch tremie pipe to top of HOLEPLUG Bentonite. Approximately 50 gallons placed within remaining 2-inch well pipe
5. Each grout mixture and grout surface return met the 10.0 lbs/gallon minimum.

| SKETCH (NOT TO SCALE) | DIAMETER 2" | | DEPTH | ELEVATION |
|---|---|---|---|---|
| Four bollards, concrete pad, and well cover removed. Two-inch well casing cut to match existing grade (8/5/2020). | | GROUND SURFACE | 0.0 | 536.8 |
| One full 30% Solids Bentonite Grout mixture (see Sealant Mixture Raatio above) placed and a half batch, 15 gallons of water and one 50 pound bag of Halliburton Aqua Guard, mixed to complete grouting. Only 5 to 10 gallons of the half batch placed within well casing. | | TOP OF BENTONITE GROUT<br>30% Solids Bentonite Grout | | |

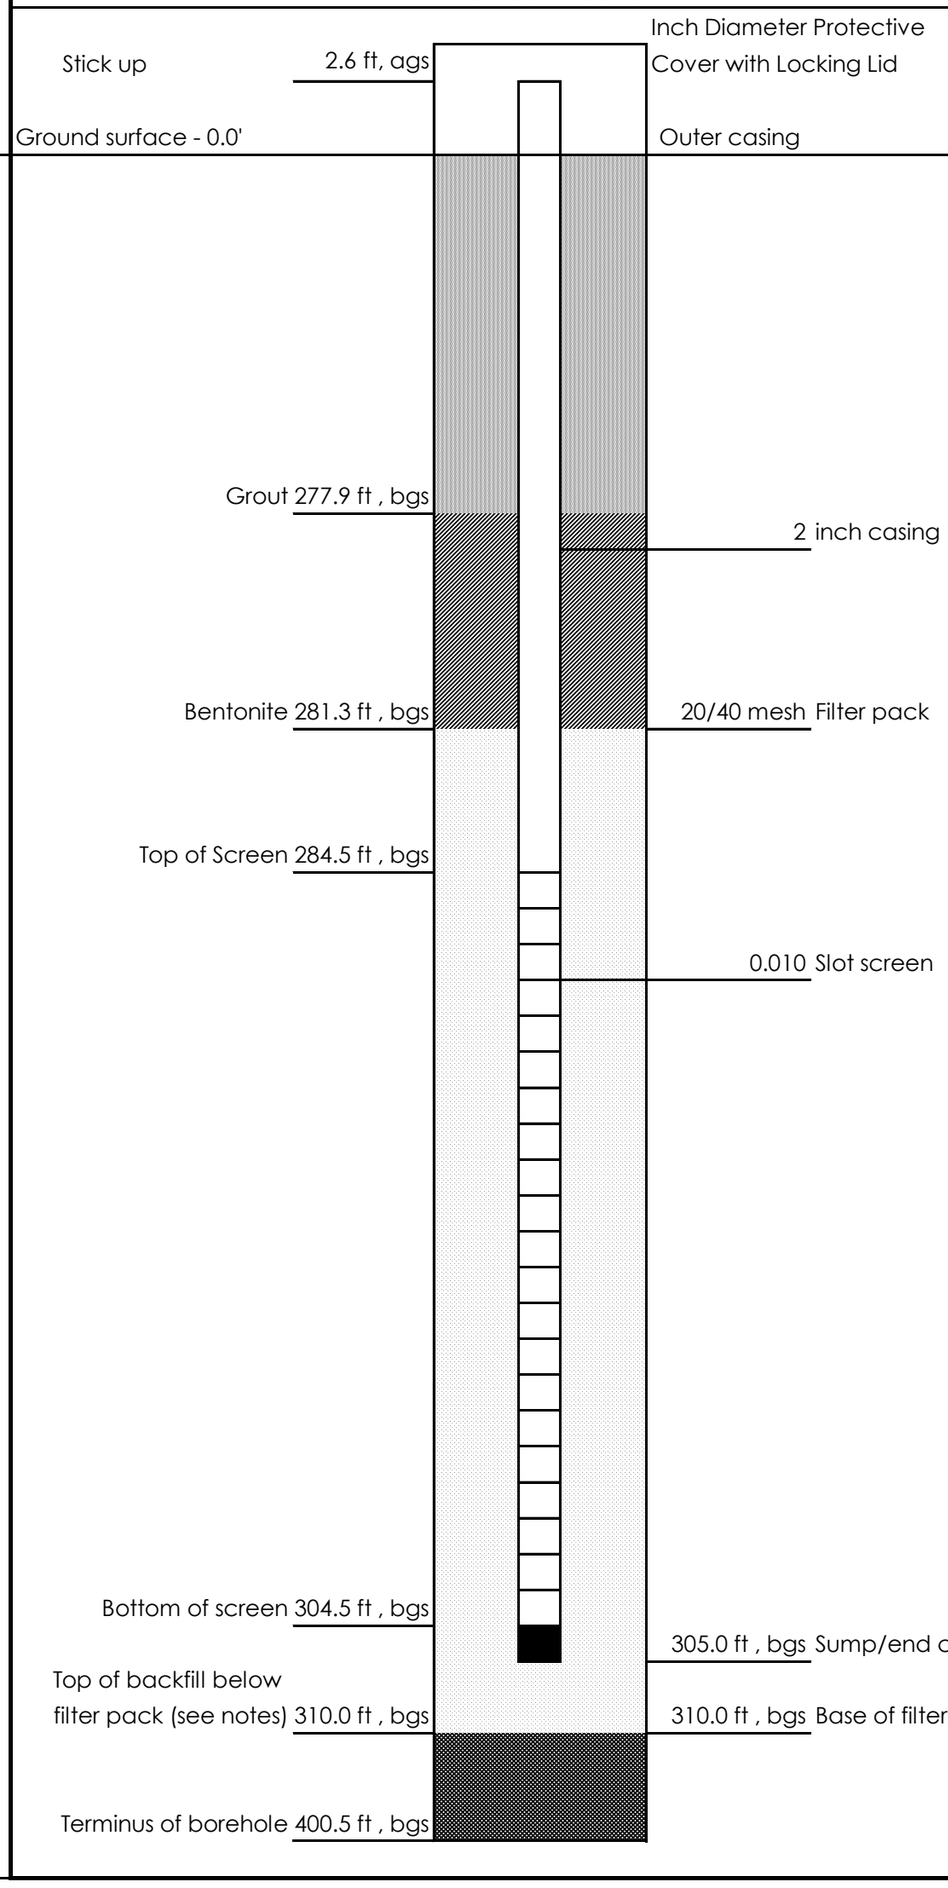
| Project Name: | Plant Miller CCR Delineation | Date Started: | 12/6/2019 | Date Completed: | 12/9/2019 |
| Borehole/Well No: | MR-AP-MW-36H | Northing (ft): | 1312347.32 | Easting (ft): | 2105804.03 |
| Plant Name: | Plant Miller | Latitude: | 33.60684518 | Longitude: | -87.04903809 |
| Plant Address: | 4250 Porter Road Quinton, AL | Location Datum: | AL NAD83 | Elevation Datum: | MSL |
| Project & Task Number: | APC716737 | Surface/ Ground Elevation: | 536.84 | Stickup (ft, ags): | 2.5 |
| Goals/Task: | Delineation Well Installation | Borehole Diameter (in): | 6.0 | Borehole Depth (ft, bgs): | 400.5 |
| Drilling Company: | Cascade | Well Casing Diameter (in): | 2.0 | Well Depth (ft, bgs): | 305.0 |
| Drilling Equipment/Rig Type: | Truck Mounted Sonic Rig | Top of Casing elev (ft): | 539.44 | Screen length (ft): | 20.0 |
| Drilling Method: | Air Hammer | DTW at Completion (ft, bgs): | 207.61 (See Note) | | |
| Sampling Method: | NS | | | | |
| Prepared By: | Scott Baxter | | | | |
| Reviewed By: | Brandon Coates | | | | |

***Not to Scale**

**Depth (feet)**

**Well Construction**



**Materials Inventory**

Stick up: 2.6 ft, ags

Casing Type (steel or PVC, schedule 40 or 80):
PVC Schedule 40

Casing
Top: 0.5 ft, ags Bottom: 284.5 ft, bgs

Screen Type:
4"ID x 2"ID U-pack

Screen Slot Size:
0.010"

Screen
Top: 284.5 ft, bgs Bottom: 304.5 ft, bgs

Sump/end cap
Top: 304.5 ft, bgs Bottom: 305.0 ft, bgs

Grout Quantity:
365 gallons

Grout Type:
BAROID AQUA GARD

Grout
Top: 0.5 ft, bgs Bottom: 277.9 ft, bgs

Bentonite Type:
Pel Plug 1/4" Coated Pellets

Bentonite Seal
Top: 277.9 ft, bgs Bottom: 281.3 ft, bgs

Filter Pack - Pre-pack and Annular Space
Type (manufacturer, size):
20/40 Mesh

Filter Pack:
Top: 281.3 ft, bgs Bottom: 310.0 ft, bgs

Notes: Bentonite seal hydrated 4-hours prior to grout backfill placed.
DTW = 2-4-20 at time of development
NS = No samples were collected

Backfill below sand pack: Boring backfilled with 90.5 feet of
Pel Plug 1/4" Coated Pellets

# Appendix C

# APPENDIX C ANALYTICAL DATA SUMMARY

Abbreviations:

1. mg/L - Milligrams per liter
2. pCi/L - Picocuries per liter
3. N/A indicates the constituent was not analyzed during the sampling event.
4. J value indicates the result is greater that or equal to the Method Detection Limit (MDL) and less that the Practical Quantitation Limit (PQL).
Values are displayed as less than the PQL with a J.
5. Non-Detect indicates the result was not detected above the MDL and is considered a non-detect.
6. Radium data is a combination of radium isotopes 226 and 228. When results are reported below the MDC (Minimum Detectable Concentration), data is displayed with an accompanying U. The MDC varies depending upon the sample amount and elapsed time of the measurement.
7. Annual sampling for Appendix IV constituents only was completed following initiation of assessment monitoring. Appendix III constituents were not required during this monitoring event.

***Field Case Narrative***

# Gorgas Ash Pond

## 2020 Compliance Event 1

All samples were collected using methods defined in Alabama Power's Water Field Group Low-Flow Groundwater Sampling Procedure and the associated site-specific Sampling and Analysis Plan (SAP).

Turbidity levels less than 10 NTU were not able to be achieved after extended pumping for wells MW-7, MW-12V & MW-26H. A complete sample set for totals analysis was collected followed by a field filtered set for dissolved analysis.

Due to low yield, wells MW-18V, MW-32H and MW-17V were sampled using the Minimal Purge Method, as defined in the SAP.

Rainy conditions were present when pumping and sampling wells MW-21V and MW-12V.

Heavy vehicle traffic and dusty conditions were present when pumping and sampling wells MW-12 and MW-15.

Suspected iron bacteria was present during initial pumping of well MW-6S and discharge water from MW-34HO appeared cloudy and black prior to sampling.

Field quality control procedures were performed as follows:

- Blanks and Sample Duplicates were collected as described in the SAP.
- Calibration verifications for all required field parameters were performed daily, before and after sample collection.

April 14, 2020

Dear Dustin Brooks,

Enclosed are the analytical results for sample(s) received by the laboratory between March 19, 2020 and March 26, 2020. All results reported herein conform to the laboratory's most current Quality Assurance Manual. Results marked with an asterisk conform to the most current applicable TNI/NELAC requirements. Exceptions will be noted in the body of the report.

Laboratory certification ID: E571114
Issued By: State of Florida, Department of Health
Expiration: June 30, 2020

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Quality Control: Laura Midkiff

4. All of the above samples were analyzed by EPA 200.7 and prepared by EPA 1638.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- Prior to sample analysis, an initial calibration verification (ICV) was analyzed, and all criteria were met.
- Following the ICV, an initial calibration blank (ICB) was analyzed and was below the limit of quantitation for all requested analytes.
- All continued calibration verification (CCV) were within the acceptance criteria for the requested analytes.
- All continued calibration blanks (CCB) were below the limit of quantitation for the requested analytes.
- A preparation method blank and laboratory control sample were digested and analyzed with the samples in each digestion batch.
- All laboratory control sample criteria were met.
- The method blank associated with each digestion batch passed all acceptance criteria for all requested analytes.
- All calibration curve requirements were within acceptance criteria.
- All sample internal standard criteria were met.
- The high standard readbacks associated with EPA 200.7 were within acceptance criteria.
- It is noted that the QC summary page typically provides the QC results from the original batch analytical sequence. If dilutions were subsequently performed to bring sample concentrations within the calibration range, any additional QC data from the dilution analyses may need to be obtained from the laboratory. Any qualifications applied to original analyses or dilution re-analyses are based upon QC data available at the time of review.

Matrix Specific Quality Control Procedures:

Similarity of matrix and therefore relevance of matrix specific QC results should not be automatically inferred for any sample other than the sample selected for QC.

- A matrix spike and matrix spike duplicate were digested and analyzed with each ICP batch. All acceptance criteria for accuracy were met.
- A matrix spike and matrix spike duplicate were digested and analyzed with each ICP batch. All acceptance criteria for precision were met.

7. The following samples were diluted due to the analyzed sample concentration being greater than the high standard of the calibration curve:

| Sample ID | Analyte | Dilution Factor |
|---|---|---|
| BA05404 | Calcium | 10.15 |
| BA05407 | Calcium | 10.15 |
| BA05412 | Calcium | 10.15 |
| BA05413 | Calcium | 10.15 |
| BA05414 | Calcium | 10.15 |
| BA05415 | Calcium | 10.15 |
| BA05418 | Calcium | 10.15 |
| BA05419 | Calcium | 10.15 |
| BA05421 | Calcium | 10.15 |
| BA05422 | Calcium | 10.15 |
| BA05846 | Calcium | 10.15 |
| BA05847 | Calcium | 10.15 |
| BA05848 | Calcium | 10.15 |
| BA05850 | Calcium | 10.15 |
| BA05855 | Calcium | 10.15 |
| BA05856 | Calcium | 10.15 |

8. The raw data results are shown with dilution factors included.

1. This report consists of all MWs and corresponding Lab IDs listed on the Chain of Custody.
2. Refer to comments on Chain of Custody for information regarding sample receipt.
3. All standards and solutions are NIST/ISO/IEC/Guide 34 traceable and were used within their recommended shelf life.

| Sample ID | Batch ID | Project ID |
|---|---|---|
| BA05417 | 669624 | WMWGORAP_1268 |
| BA05857 | 669624 | WMWGORAP_1268 |
| BA05871 | 669624 | WMWGORAP_1268 |

4. All of the above samples were analyzed and prepared by EPA 200.8 for dissolved analysis.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- All tune and calibration met criteria for all requested analytes.
- Prior to sample analysis, an initial calibration verification (ICV) was analyzed and all criteria were met.
- Following the ICV, an initial calibration blank (ICB) was analyzed and was below the limit of quantitation for all requested analytes.
- All continued calibration verification (CCV) were within the acceptance criteria for the requested analytes.
- All continued calibration blanks (CCB) were below the limit of quantitation for the requested analytes.
- Due to no filtered method blank (MB) or laboratory control sample (LCS) submitted with the sample set, an unfiltered MB and LCS were analyzed with the samples in each batch.
- All laboratory control sample criteria were met.
- The method blank associated with each preparation batch passed all acceptance criteria for all requested analytes.
- The interference check samples associated with EPA 200.8 were analyzed and passed for all requested analytes.
- All sample internal standard criteria were met.

Matrix Specific Quality Control Procedures:

Similarity of matrix and therefore relevance of matrix specific QC results should not be automatically inferred for any sample other than the sample selected for QC.

- A matrix spike and matrix spike duplicate were analyzed with each ICPMS batch. All acceptance criteria for accuracy were met.
- A matrix spike and matrix spike duplicate were analyzed with each ICPMS batch. All acceptance criteria for precision were met.

7. All samples were analyzed without a dilution factor.

8. The raw data results are shown with dilution factors included.

4. All of the above samples were analyzed by Standard Method 2540C.
5. All samples were analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- A Method Blank was analyzed with each batch. All criteria were met.
- All final weights of samples, standards, and blanks agreed within 0.5mg of the previous weight.
- A sample duplicate was analyzed with each batch. RPD/2 was less than 5%.
- A laboratory control sample was analyzed with each batch. All criteria were met.
- Samples were between 2.5mg and 200mg residue.
- All samples with residue <2.5mg had the maximum volume of 150mL filtered. Affected samples are as follows:
    - BA05403
    - BA05423
    - BA05851
    - BA05854
    - BA05865

4. All of the above samples analyzed and prepared by SM4500 Cl E, SM4500 F G, and SM4500 SO4 E.
5. All samples were analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- All calibration met criteria for the requested analyte.
- Prior to sample analysis, an initial calibration verification (ICV), and all criteria were met.
- Prior to sample analysis, an initial calibration blank (ICB) was analyzed and was below the method detection limit for the requested analyte.
- All continued calibration verification (CCV) were within the acceptance criteria for the requested analyte.
- All continued calibration blanks (CCB) were below the limit of quantitation for the requested analyte.
- It is noted that the QC summary page typically provides the QC results from the original batch analytical sequence. If dilutions were subsequently performed to bring sample concentrations within the calibration range, any additional QC data from the dilution analyses may need to be obtained from the laboratory. Any qualifications applied to original analyses or dilution re-analyses are based upon QC data available at the time of review.

Matrix Specific Quality Control Procedures:

Similarity of matrix and therefore relevance of matrix specific QC results should not be automatically inferred for any sample other than the sample selected for QC.

- A matrix spike was analyzed with each batch. Acceptance criteria for accuracy were met.
- A sample duplicate was analyzed with each batch. Acceptance criteria for precision were met.

7. The following samples were diluted due to the analyzed sample concentration being greater than high standard of the calibration curve:

| Sample ID | Analyte | Dilution Factor |
|---|---|---|
| BA05401 | Sulfate | 3 |
| BA05404 | Chloride & Sulfate | 10 & 40 |
| BA05405 | Chloride & Sulfate | 3 & 2 |
| BA05406 | Chloride & Sulfate | 3 & 3 |
| BA05407 | Chloride & Sulfate | 10 & 10 |
| BA05408 | Sulfate | 10 |
| BA05409 | Chloride & Sulfate | 10 & 25 |
| BA05411 | Chloride & Sulfate | 4 & 16 |
| BA05412 | Sulfate | 10 |
| BA05413 | Sulfate | 10 |
| BA05414 | Sulfate | 4 |
| BA05415 | Sulfate | 20 |
| BA05416 | Sulfate | 10 |
| BA05417 | Sulfate | 10 |
| BA05418 | Sulfate | 8 |
| BA05422 | Sulfate | 16 |
| BA05424 | Chloride & Sulfate | 4 & 3 |
| BA05847 | Sulfate | 25 |
| BA05848 | Sulfate | 25 |
| BA05855 | Chloride & Sulfate | 200 & 50 |
| BA05858 | Chloride & Sulfate | 5 & 10 |
| BA05860 | Chloride & Sulfate | 8 & 20 |
| BA05861 | Sulfate | 20 |
| BA05862 | Sulfate | 20 |
| BA05864 | Chloride | 2 |
| BA05866 | Sulfate | 4 |
| BA05867 | Sulfate | 4 |

8. The raw data results are shown with dilution factors included.

# *Definitions*

Alabama Power

| Abbreviation | Description |
|---|---|
| DF | Dilution Factor |
| LCS | Lab Control Sample |
| LFM | Lab Fortified Matrix |
| MB | Method Blank |
| MDL | Method Detection Limit; minimum concentration of an analyte that can be determined with 99% confidence that the concentration is greater than zero. |
| MS | Matrix Spike |
| MSD | Matrix Spike Duplicate |
| Prec | Precision (% RPD) |
| Q | Qualifier; comment used to note deviations or additional information associated with analytical results. |
| QC | Quality Control |
| Rec | Recovery of Matrix Spike |
| RL | Reporting Limit; lowest concentration at which an analyte can be quantitatively measured. |
| Vio Spec | Violation Specification; regulatory limit which has been exceeded by the sample analyzed. |

| Qualifier | Description |
|---|---|
| FA | Field results were reviewed by the Water Field Group. |
| J | Reported value is an estimate because concentration is less than reporting limit. |
| U | Compound was analyzed, but not detected. |

**Job Narrative**
**400-186042-1**

**RAD**

Method 9315: Radium-226 Prep Batch 160-466598. Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative. Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date. BA05892 PZ-22 (400-186042-45), BA05893 PZ-22 DUP (400-186042-46), BA05894 PZ-16 (400-186042-47), BA05894 PZ-16 (400-186042-47[MS]), BA05894 PZ-16 (400-186042-47[MSD]), BA05895 MW-16D (400-186042-48), BA05896 MW-26H (400-186042-49), BA05897 MW-26H DIS (400-186042-50), (LCS 160-466598/1-A) and (MB 160-466598/21-A)

Method 9315: Radium-226 Prep Batch 160-466543. Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative. Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date. BA05433 MW-15V (400-186042-9), BA05434 MW-15 (400-186042-10), BA05435 MW-21 (400-186042-11), BA05436 MW-6S (400-186042-12), BA05437 MW-6S DUP (400-186042-13), BA05438 MW-6D (400-186042-14), BA05438 MW-6D (400-186042-14[MS]), BA05438 MW-6D (400-186042-14[MSD]), BA05439 MW-23H (400-186042-15), BA05440 MW-7 (400-186042-16), BA05441 MW-7 DIS (400-186042-17), BA05442 MW-41HD (400-186042-18), BA05443 MW-24H (400-186042-19), BA05444 MW-8 (400-186042-20), BA05445 MW-12 (400-186042-21), BA05446 MW-18 (400-186042-22), BA05447 FB-4 (400-186042-23), BA05448 MW-31H (400-186042-24), BA05872 MW-9V (400-186042-25), BA05873 MW-42H (400-186042-26), (LCS 160-466543/1-A) and (MB 160-466543/22-A)

Method 9315: Radium-226 Prep Batch 160-466586. Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative. Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date. BA05874 MW-42H DUP (400-186042-27), BA05875 MW-38H (400-186042-28), BA05876 MW-19 (400-186042-29), BA05877 EB-1 (400-186042-30), BA05878 MW-29H (400-186042-31), BA05879 MW-17V (400-186042-32), BA05880 FB-2 (400-186042-33), BA05881 MW-21V (400-186042-34), BA05882 MW-12V (400-186042-35), BA05883 MW-12V DIS (400-186042-36), BA05884 MW-25HA (400-186042-37), BA05884 MW-25HA (400-186042-37[MS]), BA05884 MW-25HA (400-186042-37[MSD]), BA05885 MW-2 (400-186042-38), BA05886 MW-43HO (400-186042-39), BA05887 PZ-18 (400-186042-40), BA05888 PZ-18 DUP (400-186042-41), BA05889 MW-18V (400-186042-42), BA05890 MW-32H (400-186042-43), BA05891 FB-3 (400-186042-44), (LCS 160-466586/1-A) and (MB 160-466586/22-A)

Methods 9315: Radium-226 Prep Batch 160-466701. Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative. Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date. BA05425 MW-17 (400-186042-1), BA05426 MW-28H (400-186042-2), BA05427 FB-1 (400-186042-3), BA05428 MW-34HO (400-186042-4), BA05429 MW-35HO (400-186042-5), BA05430 MW-36H (400-186042-6), BA05431 MW-33HO (400-186042-7), BA05432 MW-30HA (400-186042-8), (LCS 160-466701/1-A), (MB 160-466701/20-A), (440-263721-A-1-A), (440-263721-A-1-B MS) and (440-263721-A-1-C MSD)

Method 9320: Radium-228 Prep Batch 160-466601. The detection goal was not met for the following sample due to the presence of matrix interferences: BA05896 MW-26H (400-186042-49). See prep NCM 160-193363. Analytical results are reported with the detection limit achieved.

Method 9320: Ra-228 Prep Batch 160-466601. Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative. Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date. BA05892 PZ-22 (400-186042-45), BA05893 PZ-22 DUP (400-186042-46), BA05894 PZ-16 (400-186042-47), BA05894 PZ-16 (400-186042-47[MS]), BA05894 PZ-16 (400-186042-47[MSD]), BA05895 MW-16D (400-186042-48), BA05896 MW-26H (400-186042-49), BA05897 MW-26H DIS (400-186042-50), (LCS 160-466601/1-A) and (MB 160-466601/21-A)

Method 9320: Ra-228 Prep Batch 160-466588. The detection goal was not met for the following sample due to the presence of matrix interferences: BA05882 MW-12V (400-186042-35). See Prep NCM 160-193359. Analytical results are reported with the detection limit achieved.

Method 9320: Ra-228 Prep Batch 160-466588. The detection goal was not met for the following sample due to insufficient sample available for analysis: BA05884 MW-25HA (400-186042-37). See Prep NCM 160-193360. Analytical results are reported with the

## Job ID: 400-186042-1 (Continued)

### Laboratory: Eurofins TestAmerica, Pensacola (Continued)

detection limit achieved.

Method 9320: Ra-228 Prep Batch 160-466588. Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative. Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date. BA05874 MW-42H DUP (400-186042-27), BA05875 MW-38H (400-186042-28), BA05876 MW-19 (400-186042-29), BA05877 EB-1 (400-186042-30), BA05878 MW-29H (400-186042-31), BA05879 MW-17V (400-186042-32), BA05880 FB-2 (400-186042-33), BA05881 MW-21V (400-186042-34), BA05882 MW-12V (400-186042-35), BA05883 MW-12V DIS (400-186042-36), BA05884 MW-25HA (400-186042-37), BA05884 MW-25HA (400-186042-37[MS]), BA05884 MW-25HA (400-186042-37[MSD]), BA05886 MW-43HO (400-186042-39), BA05887 PZ-18 (400-186042-40), BA05888 PZ-18 DUP (400-186042-41), BA05889 MW-18V (400-186042-42), BA05890 MW-32H (400-186042-43), BA05891 FB-3 (400-186042-44), (LCS 160-466588/1-A) and (MB 160-466588/22-A)

Methods 9320: Radium-228 Prep Batch 160-466705. The following batch contained a method blank (MB) that had activity above the MDC/RL. The LCS, MS and MSD were all within limits. The data has been reported with this narrative. BA05425 MW-17 (400-186042-1), BA05426 MW-28H (400-186042-2), BA05427 FB-1 (400-186042-3), BA05428 MW-34HO (400-186042-4), BA05429 MW-35HO (400-186042-5), BA05430 MW-36H (400-186042-6), BA05431 MW-33HO (400-186042-7), BA05432 MW-30HA (400-186042-8), (LCS 160-466705/1-A), (MB 160-466705/20-A), (440-263721-A-1-D), (440-263721-A-1-E MS) and (440-263721-A-1-F MSD)

Methods 9320: Ra-228 Prep Batch 160-466705. Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative. Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date. BA05425 MW-17 (400-186042-1), BA05426 MW-28H (400-186042-2), BA05427 FB-1 (400-186042-3), BA05428 MW-34HO (400-186042-4), BA05429 MW-35HO (400-186042-5), BA05430 MW-36H (400-186042-6), BA05431 MW-33HO (400-186042-7), BA05432 MW-30HA (400-186042-8), (LCS 160-466705/1-A), (MB 160-466705/20-A), (440-263721-A-1-D), (440-263721-A-1-E MS) and (440-263721-A-1-F MSD)

Methods 9320: Radium-228 Prep Batch 160-466705. The detection goal was not met for the following samples due to insufficient sample available for analysis: BA05425 MW-17 (400-186042-1), BA05426 MW-28H (400-186042-2), BA05427 FB-1 (400-186042-3), BA05428 MW-34HO (400-186042-4), BA05429 MW-35HO (400-186042-5), BA05430 MW-36H (400-186042-6), BA05431 MW-33HO (400-186042-7), BA05432 MW-30HA (400-186042-8), (LCS 160-466705/1-A), (MB 160-466705/20-A), (440-263721-A-1-D), (440-263721-A-1-E MS) and (440-263721-A-1-F MSD). The samples were prepared at a reduced aliquot due to limited volume; see prep NCM 160-193431. Due to limited volume, Job 400-186042 Samples 1-8 are unable to be re-extracted. Analytical results are reported with the detection limit achieved.

Method 9320: Radium-228 Prep Batch 160-466585. The following sample did not meet the requested limit (RL) due to the reduced sample volume attributed to the presence of matrix interferences (see prep NCM 160-193346). The data have been reported with this narrative. BA05440 MW-7 (400-186042-16).

Method 9320: Radium-228 Prep Batch 160-466585. Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative. Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date. BA05433 MW-15V (400-186042-9), BA05434 MW-15 (400-186042-10), BA05435 MW-21 (400-186042-11), BA05436 MW-6S (400-186042-12), BA05437 MW-6S DUP (400-186042-13), BA05438 MW-6D (400-186042-14), BA05438 MW-6D (400-186042-14[MS]), BA05438 MW-6D (400-186042-14[MSD]), BA05439 MW-23H (400-186042-15), BA05440 MW-7 (400-186042-16), BA05441 MW-7 DIS (400-186042-17), BA05442 MW-41HD (400-186042-18), BA05443 MW-24H (400-186042-19), BA05444 MW-8 (400-186042-20), BA05445 MW-12 (400-186042-21), BA05446 MW-18 (400-186042-22), BA05447 FB-4 (400-186042-23), BA05448 MW-31H (400-186042-24), BA05872 MW-9V (400-186042-25), BA05873 MW-42H (400-186042-26), (LCS 160-466585/1-A) and (MB 160-466585/22-A)

Method 9320: Radium-228 Prep Batch 160-468668. The Method Blank (MB) had activity above the RL and MDC. The LCS, LCSD and RER were within passing limits. The data has been reported with this narrative. BA05885 MW-2 (400-186042-38), (LCS 160-468668/1-A), (LCSD 160-468668/2-A) and (MB 160-468668/4-A)

Method 9320: Radium-228 Prep Batch 160-468668. The detection goal was not met for the following sample due to limited volume due to re-prep: BA05885 MW-2 (400-186042-38). Analytical results are reported with the detection limit achieved.

Method 9320: Ra-228 Prep Batch 160-468668. Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water

## Job ID: 400-186042-1 (Continued)

Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative. Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date. BA05885 MW-2 (400-186042-38), (LCS 160-468668/1-A), (LCSD 160-468668/2-A) and (MB 160-468668/4-A)

Method PrecSep_0: Radium 228 Prep Batch 160-466585. The following sample was prepared at a reduced aliquot due to cloudy appearance: BA05440 MW-7 (400-186042-16).

Method PrecSep_0: Radium 228 Prep Batch 160-466585. The following samples were prepared at a reduced aliquot due to limited volume: BA05433 MW-15V (400-186042-9), BA05434 MW-15 (400-186042-10), BA05435 MW-21 (400-186042-11), BA05436 MW-6S (400-186042-12), BA05437 MW-6S DUP (400-186042-13), BA05438 MW-6D (400-186042-14), BA05438 MW-6D (400-186042-14[MS]), BA05438 MW-6D (400-186042-14[MSD]), BA05439 MW-23H (400-186042-15), BA05440 MW-7 (400-186042-16), BA05441 MW-7 DIS (400-186042-17), BA05442 MW-41HD (400-186042-18), BA05443 MW-24H (400-186042-19), BA05444 MW-8 (400-186042-20), BA05445 MW-12 (400-186042-21), BA05446 MW-18 (400-186042-22), BA05447 FB-4 (400-186042-23), BA05448 MW-31H (400-186042-24), BA05872 MW-9V (400-186042-25) and BA05873 MW-42H (400-186042-26).

Method PrecSep_0: Radium 228 Prep Batch 160-466588. The following sample was prepared at a reduced aliquot due to slight black discoloration and cloudy appearance: BA05882 MW-12V (400-186042-35).

Method PrecSep_0: Radium 228 Prep Batch 160-466588. The following samples were prepared at a reduced aliquot due to limited volume: BA05874 MW-42H DUP (400-186042-27), BA05875 MW-38H (400-186042-28), BA05876 MW-19 (400-186042-29), BA05877 EB-1 (400-186042-30), BA05878 MW-29H (400-186042-31), BA05879 MW-17V (400-186042-32), BA05880 FB-2 (400-186042-33), BA05881 MW-21V (400-186042-34), BA05882 MW-12V (400-186042-35), BA05883 MW-12V DIS (400-186042-36), BA05884 MW-25HA (400-186042-37), BA05884 MW-25HA (400-186042-37[MS]), BA05884 MW-25HA (400-186042-37[MSD]), BA05885 MW-2 (400-186042-38), BA05886 MW-43HO (400-186042-39), BA05887 PZ-18 (400-186042-40), BA05888 PZ-18 DUP (400-186042-41), BA05889 MW-18V (400-186042-42), BA05890 MW-32H (400-186042-43) and BA05891 FB-3 (400-186042-44).

Method PrecSep_0: Radium 228 Prep Batch 160-466601. The following sample was prepared at a reduced aliquot due to cloudy appearance: BA05896 MW-26H (400-186042-49).

Method PrecSep_0: Radium 228 Prep Batch 160-466601. The following samples were prepared at a reduced aliquot due to limited volume: BA05892 PZ-22 (400-186042-45), BA05893 PZ-22 DUP (400-186042-46), BA05894 PZ-16 (400-186042-47), BA05894 PZ-16 (400-186042-47[MS]), BA05894 PZ-16 (400-186042-47[MSD]), BA05895 MW-16D (400-186042-48), BA05896 MW-26H (400-186042-49) and BA05897 MW-26H DIS (400-186042-50).

Method PrecSep_0: Radium 228 Prep Batch 160-466705. The following samples were prepared at a reduced aliquot due to limited volume: BA05425 MW-17 (400-186042-1), BA05426 MW-28H (400-186042-2), BA05427 FB-1 (400-186042-3), BA05428 MW-34HO (400-186042-4), BA05429 MW-35HO (400-186042-5), BA05430 MW-36H (400-186042-6), BA05431 MW-33HO (400-186042-7) and BA05432 MW-30HA (400-186042-8).Samples 160-37701-31,32,34,35 have a yellow discoloration.

Method PrecSep_0: Radium 228 Prep batch 160-468668. Insufficient sample volume was available to perform a sample duplicate for the following sample: BA05885 MW-2 (400-186042-38). A laboratory control sample/ laboratory control sample duplicate (LCS/LCSD) were prepared instead to demonstrate batch precision.

Method PrecSep_0: Radium 228 Prep Batch 160-468668. The following sample was prepared at a reduced aliquot due to limited volume because of re-prep: BA05885 MW-2 (400-186042-38).

Method PrecSep-21: Radium 226 Prep Batch 160-466516. The following samples were prepared at a reduced aliquot due to limited volume: BA05425 MW-17 (400-186042-1), BA05426 MW-28H (400-186042-2), BA05427 FB-1 (400-186042-3), BA05428 MW-34HO (400-186042-4), BA05429 MW-35HO (400-186042-5), BA05430 MW-36H (400-186042-6), BA05431 MW-33HO (400-186042-7) and BA05432 MW-30HA (400-186042-8).

Method PrecSep-21: Radium 226 Prep Batch 160-466543. The following samples were prepared at a reduced aliquot due to limited volume: BA05433 MW-15V (400-186042-9), BA05434 MW-15 (400-186042-10), BA05435 MW-21 (400-186042-11), BA05436 MW-6S (400-186042-12), BA05437 MW-6S DUP (400-186042-13), BA05438 MW-6D (400-186042-14), BA05438 MW-6D (400-186042-14[MS]), BA05438 MW-6D (400-186042-14[MSD]), BA05439 MW-23H (400-186042-15), BA05440 MW-7 (400-186042-16), BA05441 MW-7 DIS

## Job ID: 400-186042-1 (Continued)

### Laboratory: Eurofins TestAmerica, Pensacola (Continued)

(400-186042-17), BA05442 MW-41HD (400-186042-18), BA05443 MW-24H (400-186042-19), BA05444 MW-8 (400-186042-20), BA05445 MW-12 (400-186042-21), BA05446 MW-18 (400-186042-22), BA05447 FB-4 (400-186042-23), BA05448 MW-31H (400-186042-24), BA05872 MW-9V (400-186042-25) and BA05873 MW-42H (400-186042-26).

Method PrecSep-21: Radium 226 Prep Batch 160-466543. The following sample was prepared at a reduced aliquot due to cloudy appearance: BA05440 MW-7 (400-186042-16).

Method PrecSep-21: Radium 226 Prep Batch 160-466586. The following sample was prepared at a reduced aliquot due to slight black discoloration and cloudy appearance: BA05882 MW-12V (400-186042-35).

Method PrecSep-21: Radium 226 Prep Batch 160-466586. The following samples were prepared at a reduced aliquot due to limited volume: BA05874 MW-42H DUP (400-186042-27), BA05875 MW-38H (400-186042-28), BA05876 MW-19 (400-186042-29), BA05877 EB-1 (400-186042-30), BA05878 MW-29H (400-186042-31), BA05879 MW-17V (400-186042-32), BA05880 FB-2 (400-186042-33), BA05881 MW-21V (400-186042-34), BA05882 MW-12V (400-186042-35), BA05883 MW-12V DIS (400-186042-36), BA05884 MW-25HA (400-186042-37), BA05884 MW-25HA (400-186042-37[MS]), BA05884 MW-25HA (400-186042-37[MSD]), BA05885 MW-2 (400-186042-38), BA05886 MW-43HO (400-186042-39), BA05887 PZ-18 (400-186042-40), BA05888 PZ-18 DUP (400-186042-41), BA05889 MW-18V (400-186042-42), BA05890 MW-32H (400-186042-43) and BA05891 FB-3 (400-186042-44).

Method PrecSep-21: Radium 226 Prep Batch 160-466598. The following samples were prepared at a reduced aliquot due to limited volume: BA05892 PZ-22 (400-186042-45), BA05893 PZ-22 DUP (400-186042-46), BA05894 PZ-16 (400-186042-47), BA05894 PZ-16 (400-186042-47[MS]), BA05894 PZ-16 (400-186042-47[MSD]), BA05895 MW-16D (400-186042-48), BA05896 MW-26H (400-186042-49) and BA05897 MW-26H DIS (400-186042-50).

Method PrecSep-21: Radium 226 Prep Batch 160-466598. The following sample was prepared at a reduced aliquot due to cloudy appearance: BA05896 MW-26H (400-186042-49).

Method PrecSep-21: Radium 226 Prep Batch 160-466701. The following samples were prepared at a reduced aliquot due to limited volume: BA05425 MW-17 (400-186042-1), BA05426 MW-28H (400-186042-2), BA05427 FB-1 (400-186042-3), BA05428 MW-34HO (400-186042-4), BA05429 MW-35HO (400-186042-5), BA05430 MW-36H (400-186042-6), BA05431 MW-33HO (400-186042-7) and BA05432 MW-30HA (400-186042-8).Samples 160-37701-31,32,34,35 have a yellow discoloration.

# Method Summary

Client: Alabama Power General Test Laboratory
Project/Site: CCR Plant Gorgas

Job ID: 400-186042-1
SDG: Gorgas Ash Pond 1268

| Method | Method Description | Protocol | Laboratory |
|---|---|---|---|
| 9315 | Radium-226 (GFPC) | SW846 | TAL SL |

# Definitions/Glossary

Client: Alabama Power General Test Laboratory
Project/Site: CCR Plant Gorgas

Job ID: 400-186042-1
SDG: Gorgas Ash Pond 1268

## Qualifiers

### Rad

| Qualifier | Qualifier Description |
|---|---|
| G | The Sample MDC is greater than the requested RL. |
| U | Result is less than the sample detection limit. |

## Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|---|---|
| ¤ | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CFL | Contains Free Liquid |
| CNF | Contains No Free Liquid |
| DER | Duplicate Error Ratio (normalized absolute difference) |
| Dil Fac | Dilution Factor |
| DL | Detection Limit (DoD/DOE) |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC | Decision Level Concentration (Radiochemistry) |
| EDL | Estimated Detection Limit (Dioxin) |
| LOD | Limit of Detection (DoD/DOE) |
| LOQ | Limit of Quantitation (DoD/DOE) |
| MDA | Minimum Detectable Activity (Radiochemistry) |
| MDC | Minimum Detectable Concentration (Radiochemistry) |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| NC | Not Calculated |
| ND | Not Detected at the reporting limit (or MDL or EDL if shown) |
| PQL | Practical Quantitation Limit |
| QC | Quality Control |
| RER | Relative Error Ratio (Radiochemistry) |
| RL | Reporting Limit or Requested Limit (Radiochemistry) |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |
| TEF | Toxicity Equivalent Factor (Dioxin) |
| TEQ | Toxicity Equivalent Quotient (Dioxin) |

| Question | Answer | Comment |
|---|---|---|
| Radioactivity wasn't checked or is </= background as measured by a survey meter. | N/A | |
| The cooler's custody seal, if present, is intact. | True | |
| Sample custody seals, if present, are intact. | N/A | |
| The cooler or samples do not appear to have been compromised or tampered with. | True | |
| Samples were received on ice. | N/A | |
| Cooler Temperature is acceptable. | True | |
| Cooler Temperature is recorded. | True | 25.1°C, 26.0°C, 24.9°C IR-9 |
| COC is present. | True | |
| COC is filled out in ink and legible. | True | |
| COC is filled out with all pertinent information. | True | |
| Is the Field Sampler's name present on COC? | True | |
| There are no discrepancies between the containers received and the COC. | True | |
| Samples are received within Holding Time (excluding tests with immediate HTs) | True | |
| Sample containers have legible labels. | True | |
| Containers are not broken or leaking. | True | |
| Sample collection date/times are provided. | True | |
| Appropriate sample containers are used. | True | |
| Sample bottles are completely filled. | True | |
| Sample Preservation Verified. | True | |
| There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs | True | |
| Containers requiring zero headspace have no headspace or bubble is <6mm (1/4"). | N/A | |
| Multiphasic samples are not present. | True | |
| Samples do not require splitting or compositing. | True | |
| Residual Chlorine Checked. | N/A | |

***Field Case Narrative***

# Gorgas Ash Pond

## 2020 Event 1 Resample

All samples were collected using methods defined in Alabama Power's Water Field Group Low-Flow Groundwater Sampling Procedure and the associated site-specific Sampling and Analysis Plan (SAP).

Purge water from well MW-34HO had a black tint to it but turbidity levels were less than 5 NTU before sampling. The flow-through cell was noticed to have a black residue on the inside after sampling wells MW-33HO and MW-30HA.

Field quality control procedures were performed as follows:

- Blanks and Sample Duplicates were collected as described in the SAP.
- Calibration verifications for all required field parameters were performed daily, before and after sample collection.

June 08, 2020

Dear Dustin Brooks,

Enclosed are the analytical results for sample(s) received by the laboratory on May 14, 2020.
All results reported herein conform to the laboratory's most current Quality Assurance Manual. Results marked with an asterisk conform to the most current applicable TNI/NELAC requirements. Exceptions will be noted in the body of the report.

Laboratory certification ID: E571114
Issued By: State of Florida, Department of Health
Expiration: June 30, 2020

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Quality Control: Laura Midkiff

1. This report consists of all MWs and corresponding Lab IDs listed on the Chain of Custody.
2. Refer to comments on Chain of Custody for information regarding sample receipt.
3. All standards and solutions are NIST/ISO/IEC/Guide 34 traceable and were used within their recommended shelf life.

4. All of the above samples were analyzed by EPA 200.7 and prepared by EPA 1638.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- Prior to sample analysis, an initial calibration verification (ICV) was analyzed, and all criteria were met.
- Following the ICV, an initial calibration blank (ICB) was analyzed and was below the limit of quantitation for all requested analytes.
- All continued calibration verification (CCV) were within the acceptance criteria for the requested analytes.
- All continued calibration blanks (CCB) were below the limit of quantitation for the requested analytes.
- A preparation method blank and laboratory control sample were digested and analyzed with the samples in each digestion batch.
- All laboratory control sample criteria were met.
- The method blank associated with each digestion batch passed all acceptance criteria for all requested analytes.
- All calibration curve requirements were within acceptance criteria.

Revision 4

- All sample internal standard criteria were met.
- The spectral interference check associated with EPA 200.7 was analyzed and all acceptance criteria were met.
- It is noted that the QC summary page typically provides the QC results from the original batch analytical sequence. If dilutions were subsequently performed to bring sample concentrations within the calibration range, any additional QC data from the dilution analyses may need to be obtained from the laboratory. Any qualifications applied to original analyses or dilution re-analyses are based upon QC data available at the time of review.

Matrix Specific Quality Control Procedures:

Similarity of matrix and therefore relevance of matrix specific QC results should not be automatically inferred for any sample other than the sample selected for QC.

- A matrix spike and matrix spike duplicate were digested and analyzed with each ICP batch. All acceptance criteria for accuracy were met.
- A matrix spike and matrix spike duplicate were digested and analyzed with each ICP batch. All acceptance criteria for precision were met.

7. The following samples were diluted due to the analyzed sample concentration being greater than the high standard of the calibration curve:

| Sample ID | Analyte | Dilution Factor |
|---|---|---|
| BA08755 | Calcium | 10.15 |
| BA08756 | Calcium | 10.15 |

8. The raw data results are shown with dilution factors included.

4. All of the above samples were analyzed by EPA 200.8 and prepared by EPA 1638.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- All tune and calibration met criteria for all requested analytes.
- Prior to sample analysis, an initial calibration verification (ICV) was analyzed and all criteria were met.
- Following the ICV, an initial calibration blank (ICB) was analyzed and was below the limit of quantitation for all requested analytes.
- All continued calibration verification (CCV) were within the acceptance criteria for the requested analytes.
- All continued calibration blanks (CCB) were below the limit of quantitation for the requested analytes.
- A preparation method blank and laboratory control sample were digested and analyzed with the samples in each digestion batch.
- All laboratory control sample criteria were met.
- The method blank associated with each digestion batch passed all acceptance criteria for all requested analytes.

Revision 4

- The interference check samples associated with EPA 200.8 were analyzed and passed for all requested analytes.
- All sample internal standard criteria were met.

Matrix Specific Quality Control Procedures:

Similarity of matrix and therefore relevance of matrix specific QC results should not be automatically inferred for any sample other than the sample selected for QC.

- A matrix spike and matrix spike duplicate were digested and analyzed with each ICPMS batch. All acceptance criteria for accuracy were met.
- A matrix spike and matrix spike duplicate were digested and analyzed with each ICPMS batch. All acceptance criteria for precision were met.

7. All samples were analyzed without a dilution factor.
8. The raw data results are shown with dilution factors included.

4. All of the above samples were analyzed and prepared by EPA 245.1.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- Prior to sample analysis, an initial calibration verification (ICV) was analyzed and all criteria were met.
- Following the ICV, an initial calibration blank (ICB) was analyzed and was below the method detection limit for the requested analyte.
- All continued calibration verification (CCV) were within the acceptance criteria for the requested analyte.
- All continued calibration blanks (CCB) were below the limit of quantitation for the requested analyte.
- A preparation method blank and laboratory control sample were digested and analyzed with the samples in each digestion batch.
- All laboratory control sample criteria were met.
- The method blank associated with each digestion batch was below the limit of quantitation for the requested analyte.

Revision 4

- All calibration met criteria for the requested analyte.
- All response signals were satisfactory.

Matrix Specific Quality Control Procedures:

Similarity of matrix and therefore relevance of matrix specific QC results should not be automatically inferred for any sample other than the sample selected for QC.

- A matrix spike and matrix spike duplicate were digested and analyzed with each batch. All acceptance criteria for accuracy were met.
- A matrix spike and matrix spike duplicate were digested and analyzed with each batch. All acceptance criteria for precision were met.

7. All samples were analyzed without a dilution factor.
8. The raw data results are shown with dilution factors included.

4. All of the above samples were analyzed by Standard Method 2540C.
5. All samples were analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- A Method Blank was analyzed with each batch. All criteria were met.
- All final weights of samples, standards, and blanks agreed within 0.5mg of the previous weight.
- A sample duplicate was analyzed with each batch. RPD/2 was less than 5%.
- A laboratory control sample was analyzed with each batch. All criteria were met.
- Samples were between 2.5mg and 200mg residue.
- All samples with residue <2.5mg had the maximum volume of 150mL filtered. Affected samples are as follows:
    - BA08752
    - BA08758
    - BA08763

4. All of the above samples were analyzed and prepared by SM4500 Cl E, SM4500 F G, and SM4500 SO4 E.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- All calibration met criteria for the requested analyte.
- Prior to sample analysis, an initial calibration verification (ICV), and all criteria were met.
- Prior to sample analysis, an initial calibration blank (ICB) was analyzed and was below half the limit of quantitation for the requested analyte.
- All continued calibration verification (CCV) were within the acceptance criteria for the requested analyte.
- All continued calibration blanks (CCB) were below half the limit of quantitation for the requested analyte.
- It is noted that the QC summary page typically provides the QC results from the original batch analytical sequence. If dilutions were subsequently performed to bring sample concentrations within the calibration range, any additional QC data from the dilution analyses may need to be obtained from the laboratory. Any qualifications applied to original analyses or dilution re-analyses are based upon QC data available at the time of review.

Matrix Specific Quality Control Procedures:

Similarity of matrix and therefore relevance of matrix specific QC results should not be automatically inferred for any sample other than the sample selected for QC.

- A matrix spike was analyzed with each batch. Acceptance criteria for accuracy were met.
- A sample duplicate was analyzed with each batch. Acceptance criteria for precision were met.

7. The following samples were diluted due to the analyzed sample concentration being greater than the high standard of the calibration curve:

| Sample ID | Analyte | Dilution Factor |
|---|---|---|
| BA08754 | Sulfate | 2 |
| BA08755 | Chloride & Sulfate | 10 & 50 |
| BA08756 | Chloride & Sulfate | 10 & 50 |
| BA08759 | Chloride & Sulfate | 2 & 2 |
| BA08760 | Chloride & Sulfate | 5 & 3 |
| BA08761 | Sulfate | 16 |

8. The raw data results are shown with dilution factors included.

# *Definitions*

Alabama Power

| Abbreviation | Description |
|---|---|
| DF | Dilution Factor |
| LCS | Lab Control Sample |
| LFM | Lab Fortified Matrix |
| MB | Method Blank |
| MDL | Method Detection Limit; minimum concentration of an analyte that can be determined with 99% confidence that the concentration is greater than zero. |
| MS | Matrix Spike |
| MSD | Matrix Spike Duplicate |
| Prec | Precision (% RPD) |
| Q | Qualifier; comment used to note deviations or additional information associated with analytical results. |
| QC | Quality Control |
| Rec | Recovery of Matrix Spike |
| RL | Reporting Limit; lowest concentration at which an analyte can be quantitatively measured. |
| Vio Spec | Violation Specification; regulatory limit which has been exceeded by the sample analyzed. |

| Qualifier | Description |
|---|---|
| FA | Field results were reviewed by the Water Field Group. |
| J | Reported value is an estimate because concentration is less than reporting limit. |
| U | Compound was analyzed, but not detected. |

**Narrative**

**Job Narrative**
**400-188180-1**

**RAD**

Method 9315: Radium-226 Prep Batch 160-471105. Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative. Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date. BA08764 EB-1 (400-188180-1), BA08765 MW-28H (400-188180-2), BA08766 MW-17 (400-188180-3), BA08767 MW-34HO (400-188180-4), BA08768 MW-34HO DUP (400-188180-5), BA08769 MW-35HO (400-188180-6), BA08770 FB-1 (400-188180-7), BA08771 MW-36H (400-188180-8), BA08771 MW-36H (400-188180-8[MS]), BA08771 MW-36H (400-188180-8[MSD]), BA08772 MW-33HO (400-188180-9), BA08773 MW-30HA (400-188180-10), (LCS 160-471105/1-A) and (MB 160-471105/22-A)

Method 9315: Radium-226 Prep Batch 160-471108. Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative. Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date. BA08774 MW-2 (400-188180-11), BA08775 EB-2 (400-188180-12), (LCS 160-471108/1-A), (MB 160-471108/7-A), (160-38105-D-1-A) and (160-38105-E-1-A DU)

Method 9320: Ra-228 Prep Batch 160-471106. Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative. Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date. BA08764 EB-1 (400-188180-1), BA08765 MW-28H (400-188180-2), BA08766 MW-17 (400-188180-3), BA08767 MW-34HO (400-188180-4), BA08768 MW-34HO DUP (400-188180-5), BA08769 MW-35HO (400-188180-6), BA08770 FB-1 (400-188180-7), BA08771 MW-36H (400-188180-8), BA08771 MW-36H (400-188180-8[MS]), BA08771 MW-36H (400-188180-8[MSD]), BA08772 MW-33HO (400-188180-9), BA08773 MW-30HA (400-188180-10), (LCS 160-471106/1-A) and (MB 160-471106/22-A)

Method 9320: Radium 228 Prep Batch 160- 471109. Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative. Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date. BA08774 MW-2 (400-188180-11), BA08775 EB-2 (400-188180-12), (LCS 160-471109/1-A), (MB 160-471109/7-A), (160-38105-D-1-B) and (160-38105-E-1-B DU).

Method PrecSep_0: Radium 228 Prep Batch 160-471106. The following samples were prepared at a reduced aliquot to insure sufficient volume remains if needed for analysis: BA08764 EB-1 (400-188180-1), BA08765 MW-28H (400-188180-2), BA08766 MW-17 (400-188180-3), BA08767 MW-34HO (400-188180-4), BA08768 MW-34HO DUP (400-188180-5), BA08769 MW-35HO (400-188180-6), BA08770 FB-1 (400-188180-7), BA08771 MW-36H (400-188180-8), BA08771 MW-36H (400-188180-8[MS]), BA08771 MW-36H (400-188180-8[MSD]), BA08772 MW-33HO (400-188180-9) and BA08773 MW-30HA (400-188180-10).

Method PrecSep_0: Radium 228 Prep Batch 160-471109. The following samples were prepared at a reduced aliquot to insure sufficient volume remains if needed for analysis: BA08774 MW-2 (400-188180-11) and BA08775 EB-2 (400-188180-12).

Method PrecSep-21: Radium 226 Prep Batch 160-471105. The following samples were prepared at a reduced aliquot to insure sufficient volume remains if needed for analysis: BA08764 EB-1 (400-188180-1), BA08765 MW-28H (400-188180-2), BA08766 MW-17 (400-188180-3), BA08767 MW-34HO (400-188180-4), BA08768 MW-34HO DUP (400-188180-5), BA08769 MW-35HO (400-188180-6), BA08770 FB-1 (400-188180-7), BA08771 MW-36H (400-188180-8), BA08771 MW-36H (400-188180-8[MS]), BA08771 MW-36H (400-188180-8[MSD]), BA08772 MW-33HO (400-188180-9) and BA08773 MW-30HA (400-188180-10).

Method PrecSep-21: Radium 226 Prep Batch 160-471108. The following samples were prepared at a reduced aliquot to insure sufficient volume remains if needed for analysis: BA08774 MW-2 (400-188180-11) and BA08775 EB-2 (400-188180-12).

## Qualifiers

### Rad

| Qualifier | Qualifier Description |
|---|---|
| U | Result is less than the sample detection limit. |

## Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|---|---|
| ¤ | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CFL | Contains Free Liquid |
| CFU | Colony Forming Unit |
| CNF | Contains No Free Liquid |
| DER | Duplicate Error Ratio (normalized absolute difference) |
| Dil Fac | Dilution Factor |
| DL | Detection Limit (DoD/DOE) |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC | Decision Level Concentration (Radiochemistry) |
| EDL | Estimated Detection Limit (Dioxin) |
| LOD | Limit of Detection (DoD/DOE) |
| LOQ | Limit of Quantitation (DoD/DOE) |
| MCL | EPA recommended "Maximum Contaminant Level" |
| MDA | Minimum Detectable Activity (Radiochemistry) |
| MDC | Minimum Detectable Concentration (Radiochemistry) |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| MPN | Most Probable Number |
| MQL | Method Quantitation Limit |
| NC | Not Calculated |
| ND | Not Detected at the reporting limit (or MDL or EDL if shown) |
| NEG | Negative / Absent |
| POS | Positive / Present |
| PQL | Practical Quantitation Limit |
| PRES | Presumptive |
| QC | Quality Control |
| RER | Relative Error Ratio (Radiochemistry) |
| RL | Reporting Limit or Requested Limit (Radiochemistry) |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |
| TEF | Toxicity Equivalent Factor (Dioxin) |
| TEQ | Toxicity Equivalent Quotient (Dioxin) |
| TNTC | Too Numerous To Count |

Note: Since laboratory accreditations are subject to change, TestAmerica Laboratories, Inc. places the ownership of method, analyte & accreditation compliance upon out subcontract laboratories. This sample shipment is forwarded under chain-of-custody. If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/matrix being analyzed, the samples must be shipped back to the TestAmerica laboratory or other instructions will be provided. Any changes to accreditation status should be brought to TestAmerica Laboratories, Inc. attention immediately. If all requested accreditations are current to date, return the signed Chain of Custody attesting to said compliance to TestAmerica Laboratories, Inc.

| Possible Hazard Identification: Unconfirmed | Sample Disposal ( A fee may be assessed if samples are retained longer than 1 month): ☐ Return To Client ☐ Disposal By Lab ☐ Archive For _____ Months |

***Field Case Narrative***

# Gorgas Ash Pond

## 2020 Compliance Event 2

All samples were collected using methods defined in Alabama Power's Water Field Group Low-Flow Groundwater Sampling Procedure and the associated site-specific Sampling and Analysis Plan (SAP).

Turbidity levels less than 10 NTU were not able to be achieved after extended pumping for wells MW-7, MW-12V & MW-26H. A complete sample set for totals analysis was collected followed by a field filtered set for dissolved analysis. Matrix interferences in the groundwater caused erratic and unreliable turbidity readings. These readings were recorded as >10 NTU as an estimation. The below qualifier was used for MW-7, MW-12V & MW-26H turbidity readings:

- F – Water Field Group (WFG) qualifier; see comments for more information

Due to low yield, wells MW-18V and MW-32H were sampled using the Minimal Purge Method, as defined in the SAP.

Discharge water from MW-34HO had a black tint with tiny black particles prior to sampling.

Per customer request, APC EA WFS will, from this event forward, change the well nomenclature of MW-43HO to MW-43H.

All pH field readings, except for the final reading, for well MW-16S were qualified due to pH readings falling outside of the bracketed calibration range. The below qualifier was used:

- Q – Estimated reported value exceeded calibration range

Field quality control procedures were performed as follows:

- Blanks and Sample Duplicates were collected as described in the SAP.
- Calibration verifications for all required field parameters were performed daily, before and after sample collection.

November 03, 2020

Dear Dustin Brooks,

Enclosed are the analytical results for sample(s) received by the laboratory between September 18, 2020 and September 24, 2020. All results reported herein conform to the laboratory's most current Quality Assurance Manual. Results marked with an asterisk conform to the most current applicable TNI/NELAC requirements. Exceptions will be noted in the body of the report.

Laboratory certification ID: E571114
Issued By: State of Florida, Department of Health
Expiration: June 30, 2021

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Quality Control: Laura Midkiff

4. All of the above samples were analyzed by EPA 200.7 and prepared by EPA 1638.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- Prior to sample analysis, an initial calibration verification (ICV) was analyzed, and all criteria were met.
- Following the ICV, an initial calibration blank (ICB) was analyzed and was below the limit of quantitation for all requested analytes.
- All continued calibration verification (CCV) were within the acceptance criteria for the requested analytes.
- All continued calibration blanks (CCB) were below the limit of quantitation for the requested analytes.
- A preparation method blank and laboratory control sample were digested and analyzed with the samples in each digestion batch.
- All laboratory control sample criteria were met.
- The method blank associated with each digestion batch passed all acceptance criteria for all requested analytes.
- All calibration curve requirements were within acceptance criteria.
- All sample internal standard criteria were met.
- The spectral interference check associated with EPA 200.7 was analyzed and all acceptance criteria were met.
- It is noted that the QC summary page typically provides the QC results from the original batch analytical sequence. If dilutions were subsequently performed to bring sample concentrations within the calibration range, any additional QC data from the dilution analyses may need to be obtained from the laboratory. Any qualifications applied to original analyses or dilution re-analyses are based upon QC data available at the time of review.

Matrix Specific Quality Control Procedures:

Similarity of matrix and therefore relevance of matrix specific QC results should not be automatically inferred for any sample other than the sample selected for QC.

- A matrix spike and matrix spike duplicate were digested and analyzed with each ICP batch. All acceptance criteria for accuracy were met except for the following:
  - BA17561 Sodium MS/MSD spike level was less than 30% of sample concentration.
  - BA17785 Sodium MS/MSD spike level was less than 30% of sample concentration.
  - BA17906 Calcium MS/MSD spike level was less than 30% of sample concentration.
  - BA17909 Calcium and Sodium MS/MSD spike levels were less than 30% of sample concentrations.
- A matrix spike and matrix spike duplicate were digested and analyzed with each ICP batch. All acceptance criteria for precision were met.

7. The following samples were diluted due to the analyzed sample concentration being greater than the high standard of the calibration curve:

| Sample ID | Analyte | Dilution Factor |
|---|---|---|
| BA17551 | Sodium | 10.15 |
| BA17552 | Sodium, Iron | 10.15 |
| BA17554 | Calcium | 10.15 |

4. All of the above samples were analyzed and prepared by EPA 200.7 for dissolved analysis.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- Prior to sample analysis, an initial calibration verification (ICV) was analyzed, and all criteria were met.
- Following the ICV, an initial calibration blank (ICB) was analyzed and was below the limit of quantitation for all requested analytes.
- All continued calibration verification (CCV) were within the acceptance criteria for the requested analytes.
- All continued calibration blanks (CCB) were below the limit of quantitation for the requested analytes.
- Due to no filtered method blank (MB) or laboratory control sample (LCS) submitted with the sample set, an unfiltered MB and LCS were analyzed with the samples in each batch.
- All laboratory control sample criteria were met.
- The method blank associated with each batch passed all acceptance criteria for all requested analytes.
- All calibration curve requirements were within acceptance criteria.
- All sample internal standard criteria were met.
- The spectral interference check associated with EPA 200.7 was analyzed and all acceptance criteria were met.
- It is noted that the QC summary page typically provides the QC results from the original batch analytical sequence. If dilutions were subsequently performed to bring sample concentrations within the calibration range, any additional QC data from the dilution analyses may need to be obtained from the laboratory. Any qualifications applied to original analyses or dilution re-analyses are based upon QC data available at the time of review.

Matrix Specific Quality Control Procedures

Similarity of matrix and therefore relevance of matrix specific QC results should not be automatically inferred for any sample other than the sample selected for QC.

- A matrix spike and matrix spike duplicate were analyzed with each ICP batch. All acceptance criteria for accuracy were met, except for the following:
  - Batch #683125 Sodium MS/MSD spike level was less than 30% of the sample concentration.
  - Batch #683832 Magnesium MS/MSD spike level was less than 30% of the sample concentration.
- A matrix spike and matrix spike duplicate were analyzed with each ICP batch. All acceptance criteria for precision were met.

7. The following samples were diluted due to the analyzed sample concentration being greater than the high standard of the calibration curve:

| Sample ID | Analyte | Dilution Factor |
|---|---|---|
| BA17553 | Sodium | 101.5 |
| BA17557 | Iron | 101.5 |
| BA17784 | Iron | 10.15 |
| BA17785 | Iron | 10.15 |
| BA17796 | Sodium | 10.15 |

8. The raw data results are shown with dilution factors included.

4. All of the above samples were analyzed by EPA 200.8 and prepared by EPA 1638.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- All tune and calibration met criteria for all requested analytes.
- Prior to sample analysis, an initial calibration verification (ICV) was analyzed and all criteria were met.
- Following the ICV, an initial calibration blank (ICB) was analyzed and was below the limit of quantitation for all requested analytes.
- All continued calibration verification (CCV) were within the acceptance criteria for the requested analytes.
- All continued calibration blanks (CCB) were below the limit of quantitation for the requested analytes.
- A preparation method blank and laboratory control sample were digested and analyzed with the samples in each digestion batch.
- All laboratory control sample criteria were met.
- The method blank associated with each digestion batch passed all acceptance criteria for all requested analytes.
- The interference check samples associated with EPA 200.8 were analyzed and passed for all requested analytes.
- All sample internal standard criteria were met.

Matrix Specific Quality Control Procedures:

Similarity of matrix and therefore relevance of matrix specific QC results should not be automatically inferred for any sample other than the sample selected for QC.

- A matrix spike and matrix spike duplicate were digested and analyzed with each ICPMS batch. All acceptance criteria for accuracy were met except for the following:
    - BA17561 & BA17781 Selenium MS/MSD recoveries failed. Serial dilutions and post digestion spikes were performed. Matrix issues are suspected.
    - BA17791 Manganese MS/MSD spike level was less than 30% of sample concentration.
    - BA17909 Potassium MS/MSD spike level was less than 30% of sample concentration.
- A matrix spike and matrix spike duplicate were digested and analyzed with each ICPMS batch. All acceptance criteria for precision were met.

7. The following samples were diluted due to the analyzed sample concentration being greater than the high standard of the calibration curve:

| Sample ID | Analyte | Dilution Factor |
|---|---|---|
| BA17557 | Manganese | 5.075 |
| BA17900 | Barium | 5.075 |
| BA17909 | Potassium | 5.075 |

8. The raw data results are shown with dilution factors included.

4. All of the above samples were analyzed by Standard Method 2540C.
5. All samples were analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- A Method Blank was analyzed with each batch. All criteria were met.
- All final weights of samples, standards, and blanks agreed within 0.5mg of the previous weight.
- A sample duplicate was analyzed with each batch. RPD/2 was less than 5%.
- A laboratory control sample was analyzed with each batch. All criteria were met.
- Samples were between 2.5mg and 200mg residue.
- All samples with residue <2.5mg had the maximum volume of 150mL filtered. Affected samples are as follows:
    - BA17560
    - BA17778
    - BA17787
    - BA17904
    - BA17905

4. All of the above samples were analyzed and prepared by SM4500 Cl E, SM4500 F G, and SM4500 SO4 E.
5. All samples were prepared and analyzed within the established hold times.
6. All in house quality control procedures were followed, as described below.

General Quality Control Procedures:

- All calibration met criteria for the requested analyte.
- Prior to sample analysis, an initial calibration verification (ICV), and all criteria were met.
- Prior to sample analysis, an initial calibration blank (ICB) was analyzed and was below half the limit of quantitation for the requested analyte.
- All continued calibration verification (CCV) were within the acceptance criteria for the requested analyte.
- All continued calibration blanks (CCB) were below half the limit of quantitation for the requested analyte.
- It is noted that the QC summary page typically provides the QC results from the original batch analytical sequence. If dilutions were subsequently performed to bring sample concentrations within the calibration range, any additional QC data from the dilution analyses may need to be obtained from the laboratory. Any qualifications applied to original analyses or dilution re-analyses are based upon QC data available at the time of review.

Matrix Specific Quality Control Procedures:

Similarity of matrix and therefore relevance of matrix specific QC results should not be automatically inferred for any sample other than the sample selected for QC.

- A matrix spike was analyzed with each batch. Acceptance criteria for accuracy were met.
- A sample duplicate was analyzed with each batch. Acceptance criteria for precision were met.

7. The following samples were diluted due to the analyzed sample concentration being greater than high standard of the calibration curve:

| Sample ID | Analyte | Dilution Factor |
|---|---|---|
| BA17551 | Chloride | 8 |
| BA17552 | Sulfate | 8 |
| BA17553 | Sulfate | 8 |
| BA17554 | Sulfate | 8 |
| BA17555 | Sulfate | 8 |
| BA17556 | Sulfate | 4 |
| BA17557 | Sulfate | 50 |
| BA17558 | Sulfate | 8 |
| BA17561 | Chloride & Sulfate | 3 & 10 |
| BA17564 | Sulfate | 4 |
| BA17565 | Chloride & Sulfate | 3 & 4 |
| BA17776 | Chloride & Sulfate | 16 & 20 |
| BA17777 | Sulfate | 8 |
| BA17779 | Chloride | 2 |
| BA17780 | Sulfate | 8 |
| BA17781 | Chloride | 2 |
| BA17782 | Chloride & Sulfate | 8 & 16 |
| BA17784 | Sulfate | 16 |
| BA17785 | Sulfate | 25 |
| BA17790 | Sulfate | 25 |
| BA17791 | Sulfate | 25 |
| BA17797 | Chloride & Sulfate | 2 & 32 |
| BA17898 | Chloride | 2 |
| BA17899 | Sulfate | 4 |
| BA17903 | Chloride & Sulfate | 5 & 16 |
| BA17906 | Sulfate | 5 |
| BA17909 | Chloride & Sulfate | 100 & 50 |

8. The raw data results are shown with dilution factors included.

**Comments:** The client submitted filtered samples for dissolved analysis, but no MB or LCS were submitted. Therefore, dissolved data is qualified.
Matrix interferences in the groundwater caused erratic and unreliable turbidity values and were recorded as >10 NTU as an estimation.
A dissolved set was collected. LBM 11/03/2020

MDL's and RL's are adjusted for sample dilution, as applicable

**Comments:** The client submitted filtered samples for dissolved analysis, but no MB or LCS were submitted. Therefore, dissolved data is qualified. Selenium MS & MSD recovery was outside of acceptable limits. Serial Dilution test and post digestion spike was performed. Matrix issue is suspected. LBM 10/16/20

**Comments:** The client submitted filtered samples for dissolved analysis, but no MB or LCS were submitted. Therefore, dissolved data is qualified.
Matrix interferences in the groundwater caused erratic and unreliable turbidity values and were recorded as >10 NTU as an estimation.
A dissolved set was collected. LBM 11/03/2020

Reported: 11/3/2020
Version: 3.1

| BA17901 | Selenium, Dissolved | mg/L | 0.0000113 | 0.001 | 0.10 | 0.113 | 0.111 | 0.112 | 0.085 to 0.115 | 113 | 70 to 130 | 1.79 | 20 |

**Comments:** The client submitted filtered samples for dissolved analysis, but no MB or LCS were submitted. Therefore, dissolved data is qualified. Matrix interferences in the groundwater caused erratic and unreliable turbidity values and were recorded as >10 NTU as an estimation. A dissolved set was collected. LBM 11/03/2020
